This Course Material is brought to you for free and open access by the Physics Open Educational Resources at DigitalCommons@URI. It has been accepted for inclusion in PHY 204: Elementary Physics II (2015) by an authorized administrator of DigitalCommons@URI. For more information, please contact digitalcommons-group@uri.edu.
The electric field $\vec{E}$ generated by the two point charges, 3nC and $q_1$ (unknown), has the direction shown.

(a) Find the magnitude of $\vec{E}$.
(b) Find the value of $q_1$. 
The electric field $\vec{E}$ generated by the two point charges, 3nC and $q_1$ (unknown), has the direction shown.

(a) Find the magnitude of $\vec{E}$.
(b) Find the value of $q_1$.

Solution:

(a) $E_y = k \frac{3nC}{(2m)^2} = 6.75 \text{N/C}$,  
$E_x = E_y$,  
$E = \sqrt{E_x^2 + E_y^2} = 9.55 \text{N/C}$.

(b) $E_x = k \frac{(-q_1)}{(4m)^2}$,  
$q_1 = -\frac{(6.75 \text{N/C})(16 \text{m}^2)}{k} = -12 \text{nC}$.

Consider a point charge $Q = 5\text{nC}$ fixed at position $x = 0$.

(a) Find the electric potential $V_1$ at position $x_1 = 3\text{m}$ and the electric potential $V_2$ at position $x_2 = 6\text{m}$.

(b) If a charged particle ($q = 4\text{nC}$, $m = 1.5\text{ng}$) is released from rest at $x_1$, what are its kinetic energy $K_2$ and its velocity $v_2$ when it reaches position $x_2$?

\[Q = 5\text{nC}\]

\[\oplus\]

\[x = 0\quad x_1 = 3\text{m}\quad x_2 = 6\text{m}\]
Intermediate Exam I: Problem #2 (Spring ’05)

Consider a point charge $Q = 5\text{nC}$ fixed at position $x = 0$.

(a) Find the electric potential $V_1$ at position $x_1 = 3\text{m}$ and the electric potential $V_2$ at position $x_2 = 6\text{m}$.

(b) If a charged particle ($q = 4\text{nC}, m = 1.5\text{ng}$) is released from rest at $x_1$, what are its kinetic energy $K_2$ and its velocity $v_2$ when it reaches position $x_2$?

\[
\begin{align*}
Q &= 5\text{nC} \\
\begin{array}{c}
\oplus \\
x = 0 \\
x_1 = 3\text{m} \\
x_2 = 6\text{m}
\end{array}
\end{align*}
\]

Solution:

(a) $V_1 = k\frac{Q}{x_1} = 15\text{V}$, $V_2 = k\frac{Q}{x_2} = 7.5\text{V}$.

(b) $\Delta U = q(V_2 - V_1) = (4\text{nC})(-7.5\text{V}) = -30\text{nJ}$ $\Rightarrow \Delta K = -\Delta U = 30\text{nJ}$.

$\Delta K = K_2 = \frac{1}{2}mv_2^2$ $\Rightarrow v_2 = \sqrt{\frac{2K_2}{m}} = 200\text{m/s}$. 
Consider two plane surfaces with area vectors $\vec{A}_1$ (pointing in positive $x$-direction) and $\vec{A}_2$ (pointing in positive $z$-direction). The region is filled with a uniform electric field $\vec{E} = (2\hat{i} + 7\hat{j} - 3\hat{k})\text{N/C}$.

(a) Find the electric flux $\Phi^{(1)}_E$ through area $A_1$.

(b) Find the electric flux $\Phi^{(2)}_E$ through area $A_2$. 

\begin{center}
\begin{tikzpicture}
  \draw[->] (0,0) -- (4,0) node[anchor=north west] {x};
  \draw[->] (0,0) -- (0,3) node[anchor=south east] {y};
  \draw[->] (0,0) -- (0,4) node[anchor=south west] {z};
  \draw (0,0) -- (4,0) -- (4,3) -- (0,3) -- cycle;
  \draw (0,0) -- (3,0) node[anchor=north east] {3m};
  \draw (0,3) -- (4,3) node[anchor=south west] {3m};
  \draw (0,0) -- (0,4) node[anchor=south] {4m};
  \draw (3,0) -- (3,4) node[anchor=south] {3m};
  \draw (0,0) -- (3,4) node[anchor=north] {2m};
  \draw (0,0) -- (4,3) node[anchor=north east] {A_1};
  \draw (0,0) -- (3,0) node[anchor=north east] {A_2};
\end{tikzpicture}
\end{center}
Consider two plane surfaces with area vectors $\vec{A}_1$ (pointing in positive $x$-direction) and $\vec{A}_2$ (pointing in positive $z$-direction). The region is filled with a uniform electric field $\vec{E} = (2\hat{i} + 7\hat{j} - 3\hat{k}) \text{N/C}$.

(a) Find the electric flux $\Phi_{E}^{(1)}$ through area $A_1$.

(b) Find the electric flux $\Phi_{E}^{(2)}$ through area $A_2$.

Solution:

(a) $\vec{A}_1 = 6\hat{i} \text{m}^2$,
$$\Phi_{E}^{(1)} = \vec{E} \cdot \vec{A}_1 = (2\text{N/C})(6\text{m}^2) = 12\text{Nm}^2/\text{C}.$$  

(b) $\vec{A}_2 = 12\hat{k} \text{m}^2$,
$$\Phi_{E}^{(2)} = \vec{E} \cdot \vec{A}_2 = (-3\text{N/C})(12\text{m}^2) = -36\text{Nm}^2/\text{C}.$$
Consider two concentric conducting spherical shells. The total electric charge on the inner shell is 4C and the total electric charge on the outer shell is −3C. Find the electric charges $q_1$, $q_2$, $q_3$, $q_4$ on each surface of both shells as identified in the figure.
Consider two concentric conducting spherical shells. The total electric charge on the inner shell is $4\, \text{C}$ and the total electric charge on the outer shell is $-3\, \text{C}$. Find the electric charges $q_1, q_2, q_3, q_4$ on each surface of both shells as identified in the figure.

**Solution:**

Start with the innermost surface. Note that any excess charge is located at the surface of a conductor. Note also that the electric field inside a conductor at equilibrium vanishes.

- Gauss's law predicts $q_4 = 0$.
- Charge conservation then predicts $q_3 + q_4 = 4\, \text{C}$. Hence $q_3 = 4\, \text{C}$.
- Gauss's law predicts $q_2 = -(q_3 + q_4) = -4\, \text{C}$.
- Charge conservation then predicts $q_1 + q_2 = -3\, \text{C}$. Hence $q_1 = +1\, \text{C}$.
Consider a point charge $q = +8\text{nC}$ at position $x = 4\text{m}$, $y = 0$ as shown.

(a) Find the electric field components $E_x$ and $E_y$ at point $P_1$.

(b) Find the electric field components $E_x$ and $E_y$ at point $P_2$.

(c) Find the electric potential $V$ at point $P_3$.

(d) Find the electric potential $V$ at point $P_2$. 
Consider a point charge $q = +8\text{nC}$ at position $x = 4\text{m}$, $y = 0$ as shown.

(a) Find the electric field components $E_x$ and $E_y$ at point $P_1$.
(b) Find the electric field components $E_x$ and $E_y$ at point $P_2$.
(c) Find the electric potential $V$ at point $P_3$.
(d) Find the electric potential $V$ at point $P_2$.

Solution:

(a) $E_x = 0$, $E_y = k\frac{8\text{nC}}{(3\text{m})^2} = 7.99\text{N/C}$.

(b) $E_x = -k\frac{8\text{nC}}{(5\text{m})^2} \cos \theta = -2.88\text{N/C} \times \frac{4}{5} = -2.30\text{N/C}$.
   
   $E_y = k\frac{8\text{nC}}{(5\text{m})^2} \sin \theta = 2.88\text{N/C} \times \frac{3}{5} = 1.73\text{N/C}$.

(c) $V = k\frac{8\text{nC}}{4\text{m}} = 17.98\text{V}$.

(d) $V = k\frac{8\text{nC}}{5\text{m}} = 14.38\text{V}$. 
Consider a conducting sphere of radius $r_1 = 1\text{ m}$ and a conducting spherical shell of inner radius $r_2 = 3\text{ m}$ and outer radius $r_3 = 5\text{ m}$. The charge on the inner sphere is $Q_1 = -0.6\mu\text{C}$. The net charge on the shell is zero.

(a) Find the charge $Q_2$ on the inner surface and the charge $Q_3$ on the outer surface of the shell.
(b) Find magnitude and direction of the electric field at point $A$ between the sphere and the shell.
(c) Find magnitude and direction of the electric field at point $B$ inside the shell.
(d) Find magnitude and direction of the electric field at point $C$ outside the shell.
Intermediate Exam I: Problem #2 (Spring ’06)

Consider a conducting sphere of radius $r_1 = 1\,\text{m}$ and a conducting spherical shell of inner radius $r_2 = 3\,\text{m}$ and outer radius $r_3 = 5\,\text{m}$. The charge on the inner sphere is $Q_1 = -0.6\,\mu\text{C}$. The net charge on the shell is zero.

(a) Find the charge $Q_2$ on the inner surface and the charge $Q_3$ on the outer surface of the shell.

(b) Find magnitude and direction of the electric field at point $A$ between the sphere and the shell.

(c) Find magnitude and direction of the electric field at point $B$ inside the shell.

(d) Find magnitude and direction of the electric field at point $C$ outside the shell.

Solution:

(a) Gauss’s law implies that $Q_2 = -Q_1 = +0.6\,\mu\text{C}$.

Given that $Q_2 + Q_3 = 0$ we infer $Q_3 = -0.6\,\mu\text{C}$.

(b) $E_A = k \frac{0.6\mu\text{C}}{(2\,\text{m})^2} = 1349\,\text{N/C}$ (inward).

(c) $E_B = 0$ inside conductor.

(d) $E_C = k \frac{0.6\mu\text{C}}{(6\,\text{m})^2} = 150\,\text{N/C}$ (inward).
Consider a region of uniform electric field as shown. A charged particle is projected at time $t = 0$ with initial velocity as shown. Ignore gravity.

(a) Find the components $a_x$ and $a_y$ of the acceleration at time $t = 0$.
(b) Find the components $v_x$ and $v_y$ of the velocity at time $t = 0$.
(c) Find the components $v_x$ and $v_y$ of the velocity at time $t = 1.2s$.
(d) Find the components $x$ and $y$ of the position at time $t = 1.2s$. 

\[ q = 6 \text{mC} \]
\[ v_0 = 2 \text{m/s} \]
\[ m = 3 \text{g} \]
Consider a region of uniform electric field as shown. A charged particle is projected at time \( t = 0 \) with initial velocity as shown. Ignore gravity.

(a) Find the components \( a_x \) and \( a_y \) of the acceleration at time \( t = 0 \).

(b) Find the components \( v_x \) and \( v_y \) of the velocity at time \( t = 0 \).

(c) Find the components \( v_x \) and \( v_y \) of the velocity at time \( t = 1.2 \text{s} \).

(d) Find the components \( x \) and \( y \) of the position at time \( t = 1.2 \text{s} \).

Solution:

(a) \( a_x = \frac{q}{m} E = \frac{6 \times 10^{-3} \text{C}}{3 \times 10^{-3} \text{kg}} (5 \text{N/C}) = 10 \text{m/s}^2 \), \( a_y = 0 \).

(b) \( v_x = 0 \), \( v_y = v_0 = 2 \text{m/s} \).

(c) \( v_x = a_x t = (10 \text{m/s}^2)(1.2 \text{s}) = 12 \text{m/s} \), \( v_y = v_0 = 2 \text{m/s} \).

(d) \( x = \frac{1}{2} a_x t^2 = 0.5(10 \text{m/s}^2)(1.2 \text{s})^2 = 7.2 \text{m} \), \( y = v_y t = (2 \text{m/s})(1.2 \text{s}) = 2.4 \text{m} \).
Consider the configuration of two point charges as shown.

(a) Find magnitude and direction of the force $\mathbf{F}_{21}$ exerted by $q_2$ on $q_1$.
(b) Find magnitude and direction of the electric field $\mathbf{E}_A$ at point $P_A$.
(c) Find the electric potential $V_B$ at point $P_B$. 

$q_1 = +3 \text{nC}$  \hspace{2cm} q_2 = -3 \text{nC}

P_A \hspace{2cm} P_B

4m \hspace{2cm} 4m \hspace{2cm} 4m
Consider the configuration of two point charges as shown.

(a) Find magnitude and direction of the force $F_{21}$ exerted by $q_2$ on $q_1$.
(b) Find magnitude and direction of the electric field $E_A$ at point $P_A$.
(c) Find the electric potential $V_B$ at point $P_B$.

Solution:

(a) $F_{12} = k \frac{|3nC|^2}{(8m)^2} = 1.27nN$ (directed right).

(b) $E_A = 2k \frac{|3nC|}{(4m)^2} = 3.38N/C$ (directed right).

(c) $V_B = k \frac{(3nC)}{12m} + k \frac{(-3nC)}{4m} = -4.50V$. 
A point charge $Q_p$ is positioned at the center of a conducting spherical shell of inner radius $r_2 = 3.00 \text{ m}$ and outer radius $r_3 = 5.00 \text{ m}$. The total charge on the shell $Q_s = +7.00 \text{nC}$. The electric field at point $A$ has strength $E_A = 6.75 \text{ N/C}$ and is pointing radially inward.

(a) Find the value of $Q_p$ (point charge).
(b) Find the charge $Q_{\text{int}}$ on the inner surface of the shell.
(c) Find the charge $Q_{\text{ext}}$ on the outer surface of the shell.
(d) Find the electric field at point $B$. 
A point charge $Q_p$ is positioned at the center of a conducting spherical shell of inner radius $r_2 = 3.00\, \text{m}$ and outer radius $r_3 = 5.00\, \text{m}$. The total charge on the shell $Q_s = +7.00\, \text{nC}$. The electric field at point $A$ has strength $E_A = 6.75\, \text{N/C}$ and is pointing radially inward.

(a) Find the value of $Q_p$ (point charge).
(b) Find the charge $Q_{\text{int}}$ on the inner surface of the shell.
(c) Find the charge $Q_{\text{ext}}$ on the outer surface of the shell.
(d) Find the electric field at point $B$.

Solution:

(a) Gauss’s law implies that $-E_A (4\pi r_A^2) = \frac{Q_p}{\epsilon_0}$

\[
\Rightarrow Q_p = -3.00\, \text{nC}.
\]

(b) Gauss’s law implies that $Q_{\text{int}} = -Q_p = +3.00\, \text{nC}$.

(c) Charge conservation, $Q_{\text{int}} + Q_{\text{ext}} = Q_s = 7.00\, \text{nC}$, then implies that $Q_{\text{ext}} = +4.00\, \text{nC}$.

(d) $E_B = 0$ inside conductor.
Consider two regions of uniform electric field as shown. Charged particles of mass $m = 2\text{kg}$ and charge $q = 1\text{C}$ are projected at time $t = 0$ with initial velocities as shown. Both particles will hit the screen eventually. Ignore gravity.

(a) At what time $t_1$ does the particle in region (1) hit the screen?

(b) At what height $y_1$ does the particle in region (1) hit the screen?

(c) At what time $t_2$ does the particle in region (2) hit the screen?

(d) At what height $y_2$ does the particle in region (2) hit the screen?
Consider two regions of uniform electric field as shown. Charged particles of mass \( m = 2 \text{kg} \) and charge \( q = 1 \text{C} \) are projected at time \( t = 0 \) with initial velocities as shown. Both particles will hit the screen eventually. Ignore gravity.

(a) At what time \( t_1 \) does the particle in region (1) hit the screen?
(b) At what height \( y_1 \) does the particle in region (1) hit the screen?
(c) At what time \( t_2 \) does the particle in region (2) hit the screen?
(d) At what height \( y_2 \) does the particle in region (2) hit the screen?

**Solution:**

(a) \( x_1 = \frac{1}{2} a t_1^2 \) with \( a = \frac{q}{m} E = 2.5 \text{m/s}^2 \),
\[
 x_1 = 8 \text{m} \quad \Rightarrow \quad t_1 = 2.53 \text{s}.
\]
(b) \( y_1 = v_0 t_1 = 5.06 \text{m} \).
(c) \( x_2 = v_0 t_2 \) \( \Rightarrow \quad t_2 = \frac{8 \text{m}}{2 \text{m/s}} = 4 \text{s} \).
(d) \( y_2 = \frac{1}{2} a t_2^2 = 20 \text{m} \).
Consider two point charges positioned in the $xy$-plane as shown.

(a) Find the magnitude $F$ of the force between the two charges.
(b) Find the components $E_x$ and $E_y$ of the electric field at point $O$.
(c) Find the electric potential $V$ at point $O$.
(d) Find the potential energy $U$ of charge $q_2$ in the presence of charge $q_1$. 

\[ \begin{align*}
q_1 &= -4 \text{nC} \\
q_2 &= +8 \text{nC} \\
O &
\end{align*} \]
Consider two point charges positioned in the $xy$-plane as shown.

(a) Find the magnitude $F$ of the force between the two charges.
(b) Find the components $E_x$ and $E_y$ of the electric field at point $O$.
(c) Find the electric potential $V$ at point $O$.
(d) Find the potential energy $U$ of charge $q_2$ in the presence of charge $q_1$.

Solution:

(a) $F = k \frac{|q_1 q_2|}{(5m)^2} = 1.15 \times 10^{-8} \text{N}$.

(b) $E_x = -k \frac{|q_2|}{(4m)^2} = -4.5 \text{N/C}$,

$E_y = +k \frac{|q_1|}{(3m)^2} = +4.0 \text{N/C}$.

(c) $V = k \frac{q_2}{4m} + k \frac{q_1}{3m} = 18 \text{V} - 12 \text{V} = 6 \text{V}$.

(d) $U = k \frac{q_1 q_2}{5m} = -57.6 \text{nJ}$.
Consider a region of uniform electric field $E_x = -5 \text{N/C}$. A charged particle (charge $Q = 2 \text{C}$, mass $m = 3 \text{kg}$) is launched from initial position $x = 0$ with velocity $v_0 = 10 \text{m/s}$ in the positive $x$-direction.

(a) Find the (negative) acceleration $a_x$ experienced by the particle.
(b) Find the time $t_s$ it takes the particle to come to a stop.
(c) Find the position $x_s$ of the particle at time $t_s$.
(d) Find the work $W$ done by the electric field to bring the particle to a stop.
Consider a region of uniform electric field $E_x = -5 \text{N/C}$. A charged particle (charge $Q = 2 \text{C}$, mass $m = 3 \text{kg}$) is launched from initial position $x = 0$ with velocity $v_0 = 10 \text{m/s}$ in the positive $x$-direction.

(a) Find the (negative) acceleration $a_x$ experienced by the particle.
(b) Find the time $t_s$ it takes the particle to come to a stop.
(c) Find the position $x_s$ of the particle at time $t_s$.
(d) Find the work $W$ done by the electric field to bring the particle to a stop.

Solution:

(a) $a_x = \frac{2 \text{C}}{3 \text{kg}} (-5 \text{N/C}) = -3.33 \text{m/s}^2$.

(b) $t_s = \frac{v_0}{|a_x|} = 3.00 \text{s}$.

(c) $x_s = \frac{v_0^2}{2|a_x|} = 15.0 \text{m}$.

(d) $W = \Delta K = -\frac{1}{2}mv_0^2 = -150 \text{J}$.
Consider a conducting spherical shell of inner radius \( r_{int} = 3 \text{ m} \) and outer radius \( r_{ext} = 5 \text{ m} \). The net charge on the shell is \( Q_{shell} = 7 \mu \text{C} \).

(a) Find the charge \( Q_{int} \) on the inner surface and the charge \( Q_{ext} \) on the outer surface of the shell.

(b) Find the direction (left/right/none) of the electric field at points \( A, B, C \).

Now place a point charge \( Q_{point} = -3 \mu \text{C} \) into the center of the shell \( (r = 0 \text{ m}) \).

(c) Find the charge \( Q_{int} \) on the inner surface and the charge \( Q_{ext} \) on the outer surface of the shell.

(d) Find the direction (left/right/none) of the electric field at points \( A, B, C \).
Consider a conducting spherical shell of inner radius \( r_{int} = 3 \text{ m} \) and outer radius \( r_{ext} = 5 \text{ m} \). The net charge on the shell is \( Q_{shell} = 7 \mu \text{C} \).

(a) Find the charge \( Q_{int} \) on the inner surface and the charge \( Q_{ext} \) on the outer surface of the shell.

(b) Find the direction (left/right/none) of the electric field at points \( A, B, C \).

Now place a point charge \( Q_{point} = -3 \mu \text{C} \) into the center of the shell \( (r = 0 \text{ m}) \).

(c) Find the charge \( Q_{int} \) on the inner surface and the charge \( Q_{ext} \) on the outer surface of the shell.

(d) Find the direction (left/right/none) of the electric field at points \( A, B, C \).

Solution:

(a) \( Q_{int} = 0 \), \( Q_{ext} = 7 \mu \text{C} \).

(b) \( A \): none, \( B \): none, \( C \): right.

(c) \( Q_{int} = 3 \mu \text{C} \), \( Q_{ext} = 4 \mu \text{C} \).

(d) \( A \): left, \( B \): none, \( C \): right.
Consider two point charges positioned on the $x$-axis as shown.

(a) Find magnitude and direction of the electric field at point P.
(b) Find the electric potential at point P.
(c) Find the electric potential energy of an electron (mass $m = 9.1 \times 10^{-31}$ kg, charge $q = -1.6 \times 10^{-19}$ C) when placed at point P.
(d) Find magnitude and direction of the acceleration the electron experiences when released at point P.
Consider two point charges positioned on the $x$-axis as shown.

(a) Find magnitude and direction of the electric field at point $P$.
(b) Find the electric potential at point $P$.
(c) Find the electric potential energy of an electron (mass $m = 9.1 \times 10^{-31}$ kg, charge $q = -1.6 \times 10^{-19}$ C) when placed at point $P$.
(d) Find magnitude and direction of the acceleration the electron experiences when released at point $P$.

Solution:

(a) $E_x = +k \frac{8nC}{(4m)^2} + k \frac{(-8nC)}{(2m)^2} = 4.5N/C - 18N/C = -13.5N/C$ (directed left).

(b) $V = +k \frac{8nC}{4m} + k \frac{(-8nC)}{2m} = 18V - 36V = -18V$.

(c) $U = qV = (-18V)(-1.6 \times 10^{-19}C) = 2.9 \times 10^{-18}J$.

(d) $a_x = \frac{qE_x}{m} = \frac{(-1.6 \times 10^{-19}C)(-13.5N/C)}{9.1 \times 10^{-31}kg} = 2.4 \times 10^{12}ms^{-2}$ (directed right).
Consider two very large uniformly charged parallel sheets as shown. The charge densities are $\sigma_A = +7 \times 10^{-12}\text{ Cm}^{-2}$ and $\sigma_B = -4 \times 10^{-12}\text{ Cm}^{-2}$, respectively. Find magnitude and direction (left/right) of the electric fields $E_1$, $E_2$, and $E_3$. 
Consider two very large uniformly charged parallel sheets as shown. The charge densities are $\sigma_A = +7 \times 10^{-12} \text{Cm}^{-2}$ and $\sigma_B = -4 \times 10^{-12} \text{Cm}^{-2}$, respectively. Find magnitude and direction (left/right) of the electric fields $E_1$, $E_2$, and $E_3$.

Solution:

\[ E_A = \frac{|\sigma_A|}{2\epsilon_0} = 0.40 \text{N/C} \quad \text{(directed away from sheet A).} \]
\[ E_B = \frac{|\sigma_B|}{2\epsilon_0} = 0.23 \text{N/C} \quad \text{(directed toward sheet B).} \]
\[ E_1 = E_A - E_B = 0.17 \text{N/C} \quad \text{(directed left).} \]
\[ E_2 = E_A + E_B = 0.63 \text{N/C} \quad \text{(directed right).} \]
\[ E_2 = E_A - E_B = 0.17 \text{N/C} \quad \text{(directed right).} \]
(a) Consider a conducting box with no net charge on it. Inside the box are two small charged conducting cubes. For the given charges on the surface of one cube and on the inside surface of the box find the charges $Q_1$ on the surface of the other cube and $Q_2$ on the outside surface of the box.

(b) Consider a conducting box with two compartments and no net charge on it. Inside one compartment is a small charged conducting cube. For the given charge on the surface of the cube find the charges $Q_3$, $Q_4$, and $Q_5$ on the three surfaces of the box.
(a) Consider a conducting box with no net charge on it. Inside the box are two small charged conducting cubes. For the given charges on the surface of one cube and on the inside surface of the box find the charges $Q_1$ on the surface of the other cube and $Q_2$ on the outside surface of the box.

(b) Consider a conducting box with two compartments and no net charge on it. Inside one compartment is a small charged conducting cube. For the given charge on the surface of the cube find the charges $Q_3$, $Q_4$, and $Q_5$ on the three surfaces of the box.

Solution:

(a) Gauss’s law implies $Q_1 + 3C + (-5C) = 0 \Rightarrow Q_1 = +2C$.
Net charge on the box: $Q_2 + (-5C) = 0 \Rightarrow Q_2 = +5C$.

(b) Gauss’s law implies $Q_3 + (-6C) = 0 \Rightarrow Q_3 = +6C$.
Gauss’s law implies $Q_4 = 0$.
Net charge on box: $Q_3 + Q_4 + Q_5 = 0 \Rightarrow Q_5 = -6C$. 
Consider two point charges positioned as shown.

(a) Find the magnitude of the electric field at point $A$.
(b) Find the electric potential at point $A$.
(c) Find the magnitude of the electric field at point $B$.
(d) Find the electric potential at point $B$. 
Consider two point charges positioned as shown.

(a) Find the magnitude of the electric field at point $A$.
(b) Find the electric potential at point $A$.
(c) Find the magnitude of the electric field at point $B$.
(d) Find the electric potential at point $B$.

Solution:

(a) $E_A = 2k \frac{|7 \text{nC}|}{(5 \text{m})^2} = 2(2.52 \text{V/m}) = 5.04 \text{V/m}$.

(b) $V_A = k \frac{(+7 \text{nC})}{5 \text{m}} + k \frac{(-7 \text{nC})}{5 \text{m}} = 12.6 \text{V} - 12.6 \text{V} = 0$.

(c) $E_B = \sqrt{(k \frac{|7 \text{nC}|}{(6 \text{m})^2})^2 + (k \frac{|7 \text{nC}|}{(8 \text{m})^2})^2} \Rightarrow E_B = \sqrt{(1.75 \text{V/m})^2 + (0.98 \text{V/m})^2} = 2.01 \text{V/m}$.

(d) $V_B = k \frac{(+7 \text{nC})}{6 \text{m}} + k \frac{(-7 \text{nC})}{8 \text{m}} = 10.5 \text{V} - 7.9 \text{V} = 2.6 \text{V}$.
A point charge $Q_p$ is positioned at the center of a conducting spherical shell of inner radius $r_{int} = 3\text{m}$ and outer radius $r_{ext} = 5\text{m}$. The charge on the inner surface of the shell is $Q_{int} = -4\text{nC}$ and the charge on the outer surface is $Q_{ext} = +3\text{nC}$.

(a) Find the value of the point charge $Q_p$.
(b) Find direction (up/down/none) and magnitude of the electric field at point $A$.
(c) Find direction (up/down/none) and magnitude of the electric field at point $B$.
(d) Find direction (up/down/none) and magnitude of the electric field at point $C$. [not on exam]
A point charge $Q_p$ is positioned at the center of a conducting spherical shell of inner radius $r_{int} = 3\text{m}$ and outer radius $r_{ext} = 5\text{m}$. The charge on the inner surface of the shell is $Q_{int} = -4\text{nC}$ and the charge on the outer surface is $Q_{ext} = +3\text{nC}$.

(a) Find the value of the point charge $Q_p$.
(b) Find direction (up/down/none) and magnitude of the electric field at point $A$.
(c) Find direction (up/down/none) and magnitude of the electric field at point $B$.
(d) Find direction (up/down/none) and magnitude of the electric field at point $C$. [not on exam]

Solution:

(a) $Q_p = -Q_{int} = +4\text{nC}$.
(b) $E_A = 0$ inside conductor (no direction).
(c) $E_B[4\pi(6\text{m})^2] = \frac{Q_p + Q_{int} + Q_{ext}}{\epsilon_0}$
   $\Rightarrow E_B = k \frac{3\text{nC}}{(6\text{m})^2} = 0.75\text{N/C}$ (down).
(d) $E_C[4\pi(2\text{m})^2] = \frac{Q_p}{\epsilon_0}$
   $\Rightarrow E_C = k \frac{4\text{nC}}{(2\text{m})^2} = 9\text{N/C}$ (down).
An electron \((m = 9.11 \times 10^{-31} \text{kg}, q = -1.60 \times 10^{-19} \text{C})\) and a proton \((m = 1.67 \times 10^{-27} \text{kg}, q = +1.60 \times 10^{-19} \text{C})\) are released from rest midway between oppositely charged parallel plates. The plates are at the electric potentials shown.

(a) Find the magnitude of the electric field between the plates.
(b) What direction (left/right) does the electric field have?
(c) Which particle (electron/proton/both) is accelerated to the left?
(d) Why does the electron reach the plate before the proton?
(e) Find the kinetic energy of the proton when it reaches the plate.
An electron ($m = 9.11 \times 10^{-31} \text{kg}, q = -1.60 \times 10^{-19} \text{C}$) and a proton ($m = 1.67 \times 10^{-27} \text{kg}, q = +1.60 \times 10^{-19} \text{C}$) are released from rest midway between oppositely charged parallel plates. The plates are at the electric potentials shown.

(a) Find the magnitude of the electric field between the plates.
(b) What direction (left/right) does the electric field have?
(c) Which particle (electron/proton/both) is accelerated to the left?
(d) Why does the electron reach the plate before the proton?
(e) Find the kinetic energy of the proton when it reaches the plate.

Solution:

(a) $E = \frac{6 \text{V}}{0.2 \text{m}} = 30 \text{V/m}$.
(b) left
(c) proton (positive charge)
(d) smaller $m$, equal $|q|$ ⇒ larger $|q| E / m$
(e) $K = |q \Delta V| = (1.6 \times 10^{-19} \text{C})(3 \text{V}) = 4.8 \times 10^{-19} \text{J}$. 
The point charge $Q$ has a fixed position as shown.
(a) Find the components $E_x$ and $E_y$ of the electric field at point $A$.
(b) Find the electric potential $V$ at point $A$.
Now place a proton ($m = 1.67 \times 10^{-27}$ kg, $q = 1.60 \times 10^{-19}$ C) at point $A$.
(c) Find the the electric force $F$ (magnitude only) experienced by the proton.
(d) Find the electric potential energy $U$ of the proton.
The point charge $Q$ has a fixed position as shown.

(a) Find the components $E_x$ and $E_y$ of the electric field at point $A$.
(b) Find the electric potential $V$ at point $A$.

Now place a proton ($m = 1.67 \times 10^{-27}$ kg, $q = 1.60 \times 10^{-19}$ C) at point $A$.

(c) Find the electric force $F$ (magnitude only) experienced by the proton.
(d) Find the electric potential energy $U$ of the proton.

Solution:

(a) $E = k \frac{|7\text{nC}|}{(5\text{m})^2} = 2.52 \text{N/C},$

$E_x = \frac{4}{5} E = 2.02 \text{N/C},$  
$E_y = -\frac{3}{5} E = -1.51 \text{N/C}$

(b) $V = k \frac{7\text{nC}}{5\text{m}} = 12.6 \text{V}.$

(c) $F = qE = 4.03 \times 10^{-19} \text{N}.$

(d) $U = qV = 2.02 \times 10^{-18} \text{J}.$
The charged conducting spherical shell has a 2m inner radius and a 4m outer radius. The charge on the outer surface is $Q_{\text{ext}} = 8\,\text{nC}$. There is a point charge $Q_{\text{p}} = 3\,\text{nC}$ at the center.

(a) Find the charge $Q_{\text{int}}$ on the inner surface of the shell.
(b) Find the surface charge density $\sigma_{\text{ext}}$ on the outer surface of the shell.
(c) Find the electric flux $\Phi_E$ through a Gaussian sphere of radius $r = 5\,\text{m}$.
(d) Find the magnitude of the electric field $E$ at radius $r = 3\,\text{m}$. 
The charged conducting spherical shell has a 2m inner radius and a 4m outer radius. The charge on the outer surface is $Q_{\text{ext}} = 8\text{nC}$. There is a point charge $Q_p = 3\text{nC}$ at the center.

(a) Find the charge $Q_{\text{int}}$ on the inner surface of the shell.

(b) Find the surface charge density $\sigma_{\text{ext}}$ on the outer surface of the shell.

(c) Find the electric flux $\Phi_E$ through a Gaussian sphere of radius $r = 5\text{m}$.

(d) Find the magnitude of the electric field $E$ at radius $r = 3\text{m}$.

Solution:

(a) $Q_{\text{int}} = -Q_p = -3\text{nC}$.

(b) $\sigma_{\text{ext}} = \frac{Q_{\text{ext}}}{4\pi(4\text{m})^2} = 3.98 \times 10^{-11} \text{C/m}^2$.

(c) $\Phi_E = \frac{Q_{\text{ext}}}{\epsilon_0} = 904 \text{Nm}^2/\text{C}$.

(d) $E = 0$ inside conductor.
Consider a region of space with a uniform electric field $\mathbf{E} = 0.5\text{V/m} \mathbf{\hat{i}}$. Ignore gravity.

(a) If the electric potential vanishes at point 0, what are the electric potentials at points 1 and 2?

(b) If an electron ($m = 9.11 \times 10^{-31}\text{kg}$, $q = -1.60 \times 10^{-19}\text{C}$) is released from rest at point 0, toward which point will it start moving?

(c) What will be the speed of the electron when it gets there?
Consider a region of space with a uniform electric field \( \mathbf{E} = 0.5 \text{V/m} \hat{x} \). Ignore gravity.

(a) If the electric potential vanishes at point 0, what are the electric potentials at points 1 and 2?
(b) If an electron \( (m = 9.11 \times 10^{-31} \text{kg}, q = -1.60 \times 10^{-19} \text{C}) \) is released from rest at point 0, toward which point will it start moving?
(c) What will be the speed of the electron when it gets there?

Solution:

(a) \( V_1 = -(0.5 \text{V/m})(2 \text{m}) = -1 \text{V} \), \( V_2 = 0 \).

(b) \( \mathbf{F} = q \mathbf{E} = -|qE| \hat{x} \) (toward point 3).

(c) \( \Delta V = (V_3 - V_0) = 1 \text{V} \), \( \Delta U = q \Delta V = -1.60 \times 10^{-19} \text{J} \),
\[ K = -\Delta U = 1.60 \times 10^{-19} \text{J}, \quad v = \sqrt{\frac{2K}{m}} = 5.93 \times 10^5 \text{m/s}. \]
Alternatively:
\[ F = qE = 8.00 \times 10^{-20} \text{N}, \quad a = \frac{F}{m} = 8.78 \times 10^{10} \text{m/s}^2, \]
\( |\Delta x| = 2 \text{m}, \quad v = \sqrt{2a|\Delta x|} = 5.93 \times 10^5 \text{m/s}. \)
Consider two point charges at the positions shown.
(a) Find the magnitude $E$ of the electric field at point $P_1$.
(b) Find the components $E_x$ and $E_y$ of the electric field at point $P_2$.
(c) Draw the direction of the electric field at points $P_1$ and $P_2$ in the diagram.
(d) Calculate the potential difference $\Delta V = V_2 - V_1$ between point $P_2$ and $P_1$. 

\[ \begin{align*}
\text{Diagram:} & \quad \begin{array}{c}
\text{y} \\
\text{8cm} \\
\text{P}_2 \\
\text{6cm} \\
\text{x} \\
\text{P}_1 \\
\text{+2nC} \\
\text{-2nC}
\end{array}
\end{align*} \]
Consider two point charges at the positions shown.  
(a) Find the magnitude $E$ of the electric field at point $P_1$.  
(b) Find the components $E_x$ and $E_y$ of the electric field at point $P_2$.  
(c) Draw the direction of the electric field at points $P_1$ and $P_2$ in the diagram.  
(d) Calculate the potential difference $\Delta V = V_2 - V_1$ between point $P_2$ and $P_1$.

**Solution:**

(a) $E = 2k \frac{2nC}{(5cm)^2} = 1.44 \times 10^4 \text{N/C}$.  
(b) $E_x = -k \frac{2nC}{(8cm)^2} = -2.81 \times 10^3 \text{N/C}$.  
\[ E_y = k \frac{2nC}{(6cm)^2} = 5.00 \times 10^3 \text{N/C}. \]

(c) $E_1$ up and left toward negative charge; $E_2$ more up and less left  
(d) $\Delta V = V_2 - 0 = k \frac{2nC}{6cm} + k \frac{-2nC}{8cm} = 300V - 225V = 75V$.  

\[ x \quad 8\text{cm} \quad P_2 \]

\[ y \quad 6\text{cm} \quad P_1 \]

-2nC

+2nC
Two very large, thin, uniformly charged, parallel sheets are positioned as shown. Find the values of the charge densities (charge per area), $\sigma_A$ and $\sigma_B$, if you know the electric fields $E_1$, $E_2$, and $E_3$.

Consider two situations.
(a) $E_1 = 2 \text{N/C}$ (directed left), $E_2 = 0$, $E_3 = 2 \text{N/C}$ (directed right).
(b) $E_1 = 0$, $E_2 = 2 \text{N/C}$ (directed right), $E_3 = 0$. 

\[ E_{\text{1}} \quad \sigma_A \quad E_{\text{2}} \quad E_{\text{3}} \quad \sigma_B \]
Two very large, thin, uniformly charged, parallel sheets are positioned as shown. Find the values of the charge densities (charge per area), $\sigma_A$ and $\sigma_B$, if you know the electric fields $E_1$, $E_2$, and $E_3$.

Consider two situations.
(a) $E_1 = 2\text{N}/\text{C}$ (directed left), $E_2 = 0$, $E_3 = 2\text{N}/\text{C}$ (directed right).
(b) $E_1 = 0$, $E_2 = 2\text{N}/\text{C}$ (directed right), $E_3 = 0$.

Solution:
(a) The two sheets are equally charged:
$$\sigma_A = \sigma_B = 2\varepsilon_0(1\text{N}/\text{C}) = 1.77 \times 10^{-11}\text{C/m}^2.$$
(b) The two sheets are oppositely charged:
$$\sigma_A = -\sigma_B = 2\varepsilon_0(1\text{N}/\text{C}) = 1.77 \times 10^{-11}\text{C/m}^2.$$
Consider a region of uniform electric field $E_x = +7\text{N/C}$. A charged particle (charge $Q = -3\text{C}$, mass $m = 5\text{kg}$) is launched at time $t = 0$ from initial position $x = 0$ with velocity $v_0 = 10\text{m/s}$ in the positive $x$-direction. Ignore gravity.

(a) Find the force $F_x$ acting on the particle at time $t = 0$.

(b) Find the force $F_x$ acting on the particle at time $t = 3\text{s}$.

(c) Find the kinetic energy of the particle at time $t = 0$.

(d) Find the kinetic energy of the particle at time $t = 3\text{s}$.

(e) Find the work done on the particle between $t = 0$ and $t = 3\text{s}$.
Consider a region of uniform electric field $E_x = +7\text{N/C}$. A charged particle (charge $Q = -3\text{C}$, mass $m = 5\text{kg}$) is launched at time $t = 0$ from initial position $x = 0$ with velocity $v_0 = 10\text{m/s}$ in the positive $x$-direction. Ignore gravity.

(a) Find the force $F_x$ acting on the particle at time $t = 0$.
(b) Find the force $F_x$ acting on the particle at time $t = 3\text{s}$.
(c) Find the kinetic energy of the particle at time $t = 0$.
(d) Find the kinetic energy of the particle at time $t = 3\text{s}$.
(e) Find the work done on the particle between $t = 0$ and $t = 3\text{s}$.

**Solution:**

(a) $F_x = QE_x = (-3\text{C})(7\text{N/C}) = -21\text{N}$.
(b) no change from (a).
(c) $K = \frac{1}{2}(5\text{kg})(10\text{m/s})^2 = 250\text{J}$.
(d) $v_x = v_0 + a_xt = v_0 + (F_x/m)t = 10\text{m/s} + (-21\text{N}/5\text{kg})(3\text{s}) = -2.6\text{m/s}$.

$$K = \frac{1}{2}(5\text{kg})(-2.6\text{m/s})^2 = 16.9\text{J}.$$ 
(e) $W = \Delta K = 16.9\text{J} - 250\text{J} = -233\text{J}$. 

\[ m = 5\text{kg} \]
\[ E_x = +7\text{N/C} \]
\[ Q = -3\text{C} \]
\[ v_0 = 10\text{m/s} \]
Consider two point charges positioned on the $x$-axis as shown.

(a) Find magnitude and direction of the electric field at points A and B.
(b) Find the electric potential at points A and B.
(c) Find the electric potential energy of a proton (mass $m = 1.67 \times 10^{-27}$ kg, charge $q = 1.60 \times 10^{-19}$ C) when placed at point A or point B.
(d) Find magnitude and direction of the acceleration the proton experiences when released at point A or point B.
Solution:

(a) \[ E_x = -k \frac{4nC}{(2m)^2} - k \frac{(-7nC)}{(5m)^2} = -9.00 \text{N/C} + 2.52 \text{N/C} = -6.48 \text{N/C}. \]

\[ E_x = k \frac{4nC}{(6m)^2} + k \frac{(-7nC)}{(3m)^2} = 1.00 \text{N/C} - 7.00 \text{N/C} = -6.00 \text{N/C}. \]

(b) \[ V = +k \frac{4nC}{2m} + k \frac{(-7nC)}{5m} = 18.0 \text{V} - 12.6 \text{V} = 5.4 \text{V}. \]

\[ V = +k \frac{4nC}{6m} + k \frac{(-7nC)}{3m} = 6.0 \text{V} - 21.0 \text{V} = -15.0 \text{V}. \]

(c) \[ U = qV = (5.4 \text{V})(1.6 \times 10^{-19} \text{C}) = 8.64 \times 10^{-19} \text{J}. \]

\[ U = qV = (-15.0 \text{V})(1.6 \times 10^{-19} \text{C}) = -2.40 \times 10^{-18} \text{J}. \]

(d) \[ a_x = \frac{qE_x}{m} = \frac{(1.6 \times 10^{-19} \text{C})(-6.48 \text{N/C})}{1.67 \times 10^{-27} \text{kg}} = -6.21 \times 10^8 \text{m/s}^2. \]

\[ a_x = \frac{qE_x}{m} = \frac{(1.6 \times 10^{-19} \text{C})(-6.00 \text{N/C})}{1.67 \times 10^{-27} \text{kg}} = -5.75 \times 10^8 \text{m/s}^2. \]
Consider three plane surfaces (one circle and two rectangles) with area vectors $\vec{A}_1$ (pointing in positive $x$-direction), $\vec{A}_2$ (pointing in negative $z$-direction), and $\vec{A}_3$ (pointing in negative $y$-direction) as shown. The region is filled with a uniform electric field $\vec{E} = (-3\hat{i} + 9\hat{j} - 4\hat{k}) \text{N/C}$ or $\vec{E} = (2\hat{i} - 6\hat{j} + 5\hat{k}) \text{N/C}$.

(a) Find the electric flux $\Phi^{(1)}_E$ through surface 1.

(b) Find the electric flux $\Phi^{(2)}_E$ through surface 2.

(c) Find the electric flux $\Phi^{(3)}_E$ through surface 3.
Solution:

(a) \( \vec{A}_1 = \pi (1.5m)^2 \hat{i} = 7.07m^2 \hat{i}, \quad \Phi_E^{(1)} = \vec{E} \cdot \vec{A}_1 = (-3N/C)(7.07m^2) = -21.2Nm^2/C. \)

\( \vec{A}_1 = \pi (1.5m)^2 \hat{i} = 7.07m^2 \hat{i}, \quad \Phi_E^{(1)} = \vec{E} \cdot \vec{A}_1 = (2N/C)(7.07m^2) = 14.1Nm^2/C. \)

(b) \( \vec{A}_2 = (3m)(4m)(-\hat{k}) = -12m^2 \hat{k}, \quad \Phi_E^{(2)} = \vec{E} \cdot \vec{A}_2 = (-4N/C)(-12m^2) = 48Nm^2/C. \)

\( \vec{A}_2 = (3m)(4m)(-\hat{k}) = -12m^2 \hat{k}, \quad \Phi_E^{(2)} = \vec{E} \cdot \vec{A}_2 = (5N/C)(-12m^2) = -60Nm^2/C. \)

(c) \( \vec{A}_3 = (3m)(4m)(-\hat{j}) = -12m^2 \hat{j}, \quad \Phi_E^{(3)} = \vec{E} \cdot \vec{A}_3 = (9N/C)(-12m^2) = -108Nm^2/C. \)

\( \vec{A}_3 = (3m)(4m)(-\hat{j}) = -12m^2 \hat{j}, \quad \Phi_E^{(3)} = \vec{E} \cdot \vec{A}_3 = (-6N/C)(-12m^2) = 72Nm^2/C. \)
An electron \((m_e = 9.11 \times 10^{-31} \text{kg}, q_e = -1.60 \times 10^{-19} \text{C})\) and a proton \((m_p = 1.67 \times 10^{-27} \text{kg}, q_p = +1.60 \times 10^{-19} \text{C})\) are released from rest midway between oppositely charged parallel plates. The electric field between the plates is uniform and has strength \(E = 40 \text{V/m}\). Ignore gravity.

(a) Which plate is positively (negatively) charged?

(b) Find the electric forces \(\vec{F}_p\) acting on the proton and \(\vec{F}_e\) acting on the electron (magnitude and direction).

(c) Find the accelerations \(\vec{a}_p\) of the proton and \(\vec{a}_e\) of the electron (magnitude and direction).

(d) If plate 1 is at potential \(V_1 = 1 \text{V}\) at what potential \(V_2\) is plate 2?
   If plate 2 is at potential \(V_2 = 2 \text{V}\) at what potential \(V_1\) is plate 1?
Solution:

(a) plate 1 (plate 2)

(b) $F_p = |q_p|E = 6.40 \times 10^{-18}$ N. (directed right).
    
    $F_e = |q_e|E = 6.40 \times 10^{-18}$ N. (directed left).

(c) $a_p = F_p/m_p = 3.83 \times 10^9$ m/s$^2$. (directed right).
    
    $a_e = F_e/m_e = 7.03 \times 10^{12}$ m/s$^2$. (directed left).

(d) $V_2 = 1V - (40V/m)(0.4m) = -15V$.

    $V_1 = 2V + (40V/m)(0.4m) = 18V$. 
Consider two point charges positioned as shown.

- Find the magnitude of the electric field at point $A$.
- Find the electric potential at point $B$.
- Find the magnitude of the electric field at point $C$.
- Find the electric potential at point $D$. 

![Diagram of point charges and distances]
Consider two point charges positioned as shown.

- Find the magnitude of the electric field at point A.
- Find the electric potential at point B.
- Find the magnitude of the electric field at point C.
- Find the electric potential at point D.

Solution:

- \[ E_A = k \frac{|5\text{nC}|}{(3\text{m})^2} + k \frac{|-9\text{nC}|}{(7\text{m})^2} = 5.00\text{V/m} + 1.65\text{V/m} = 6.65\text{V/m}. \]
- \[ V_B = k \frac{(+5\text{nC})}{6\text{m}} + k \frac{(-9\text{nC})}{8\text{m}} = 7.50\text{V} - 10.13\text{V} = -2.63\text{V}. \]
- \[ E_C = k \frac{|5\text{nC}|}{(6\text{m})^2} + k \frac{|-9\text{nC}|}{(4\text{m})^2} = 1.25\text{V/m} + 5.06\text{V/m} = 6.31\text{V/m}. \]
- \[ V_D = k \frac{(+5\text{nC})}{8\text{m}} + k \frac{(-9\text{nC})}{6\text{m}} = 5.63\text{V} - 13.5\text{V} = -7.87\text{V}. \]
Consider a conducting sphere of radius $r_1 = 2\text{cm}$ and a conducting spherical shell of inner radius $r_2 = 6\text{cm}$ and outer radius $r_3 = 10\text{cm}$. The charges on the two surfaces of the shell are $Q_2 = Q_3 = 1.3 \text{nC}$.

(a) Find the charge $Q_1$ on the surface of the conducting sphere.
(b) Find the magnitude of the electric field at points $A$ and $B$.
(c) Find the surface charge density $\sigma_3$ on the outermost surface.
Consider a conducting sphere of radius \( r_1 = 2 \text{cm} \) and a conducting spherical shell of inner radius \( r_2 = 6 \text{cm} \) and outer radius \( r_3 = 10 \text{cm} \). The charges on the two surfaces of the shell are \( Q_2 = Q_3 = 1.3 \text{nC} \) [3.1nC].

(a) Find the charge \( Q_1 \) on the surface of the conducting sphere.
(b) Find the magnitude of the electric field at points \( A \) and \( B \).
(c) Find the surface charge density \( \sigma_3 \) on the outermost surface.

Solution:

(a) Gauss’ law implies that \( Q_1 = -Q_2 = -1.3 \text{nC} \) [−3.1nC].

(b) \[ E_A = k \frac{1.3 \text{nC}}{(4 \text{cm})^2} = 7.31 \times 10^3 \text{N/C} \]

\[ \left[ k \frac{3.1 \text{nC}}{(4 \text{cm})^2} = 1.74 \times 10^4 \text{N/C} \right]. \]

\( E_B = 0 \) inside conductor.

(c) \( \sigma_3 = \frac{Q_3}{4\pi r_3^2} = \frac{1.3 \text{nC}}{1257 \text{cm}^2} = 1.03 \times 10^{-8} \text{C/m}^2 \)

\[ \left[ \frac{3.1 \text{nC}}{1257 \text{cm}^2} = 2.47 \times 10^{-8} \text{C/m}^2 \right]. \]
Consider a point charge $Q = 6\text{nC}$ fixed at position $x = 0$.

(a) Find the electric potential energy $U_4$ of a charged particle with mass $m = 1\text{mg}$ and charge $q = 2\mu\text{C}$ placed at position $x = 4\text{cm}$.

(b) Find the electric potential energy $U_8$ of a charged particle with mass $m = 2\text{mg}$ and charge $q = -1\mu\text{C}$ placed at position $x = 8\text{cm}$.

(c) Find the kinetic energy $K_8$ of that particle, released from rest at $x = 4\text{cm}$, when it has reached position $x = 8\text{cm}$.

(d) Find the kinetic energy $K_4$ of that particle, released from rest at $x = 8\text{cm}$, when it has reached position $x = 4\text{cm}$.

(e) Find the velocity $v_8$ of that particle at $x = 8\text{cm}$.

(f) Find the velocity $v_4$ of that particle at $x = 4\text{cm}$.
Consider a point charge $Q = 6\text{nC}$ fixed at position $x = 0$.

(a) Find the electric potential energy $U_4$ of a charged particle with mass $m = 1\text{mg}$ and charge $q = 2\mu\text{C}$ placed at position $x = 4\text{cm}$.

(b) Find the electric potential energy $U_8$ of a charged particle with mass $m = 2\text{mg}$ and charge $q = -1\mu\text{C}$ placed at position $x = 8\text{cm}$.

(c) Find the kinetic energy $K_8$ of that particle, released from rest at $x = 4\text{cm}$, when it has reached position $x = 8\text{cm}$.

(d) Find the kinetic energy $K_4$ of that particle, released from rest at $x = 8\text{cm}$, when it has reached position $x = 4\text{cm}$.

(e) Find the velocity $v_8$ of that particle at $x = 8\text{cm}$.

(f) Find the velocity $v_4$ of that particle at $x = 4\text{cm}$.

Solution:

(a) $U_4 = k \frac{qQ}{4\text{cm}} = 2.7\text{mJ}$.

(b) $U_8 = k \frac{qQ}{8\text{cm}} = -0.675\text{mJ}$.

(c) $K_8 = (2.7 - 1.35)\text{mJ} = 1.35\text{mJ}$.

(d) $K_4 = (1.35 - 0.675)\text{mJ} = 0.675\text{mJ}$.

(e) $v_8 = \sqrt{\frac{2K_8}{m}} = 52.0\text{m/s}$.

(f) $v_4 = \sqrt{\frac{2K_4}{m}} = 26.0\text{m/s}$.
Two point charges are placed in the $xy$-plane as shown.
(a) Find the components $E_x$ and $E_y$ of the electric field at point $O$.
(b) Draw an arrow indicating the direction of $\vec{E}$ at point $O$.
(c) Find the electric potential $V$ at point $O$.
(d) Find the magnitude $F$ of the electric force between the two charges.
Two point charges are placed in the $xy$-plane as shown.
(a) Find the components $E_x$ and $E_y$ of the electric field at point $O$.
(b) Draw an arrow indicating the direction of $\vec{E}$ at point $O$.
(c) Find the electric potential $V$ at point $O$.
(d) Find the magnitude $F$ of the electric force between the two charges.

Solution:

(a) $E_x = -k \frac{|6nC|}{(4m)^2} = -3.38 \text{ N/C}$

(b) Up and left.

(c) $V = k \frac{6nC}{4m} + k \frac{5nC}{2m} = 13.5V + 22.5V = 36V$.

(d) $F = k \frac{|6nC||5nC|}{20m^2} = 13.5 \text{ nN}$.
The conducting spherical shell shown in cross section has a 4cm inner radius and an 8cm outer radius. A point charge $Q_p$ is placed at the center. The charges on the inner and outer surfaces of the shell are $Q_{\text{int}} = 5\, \text{nC}$ and $Q_{\text{ext}} = 7\, \text{nC}$, respectively.

(a) Find the charge $Q_p$.
(b) Find the magnitude of the electric field $E$ at radius $r = 10\, \text{cm}$.
(c) Find the surface charge density $\sigma_{\text{int}}$ on the inner surface of the shell.
(d) Find the electric flux $\Phi_E$ through a Gaussian sphere of radius $r = 6\, \text{cm}$. 
The conducting spherical shell shown in cross section has a 4cm inner radius and an 8cm outer radius. A point charge $Q_p$ is placed at the center. The charges on the inner and outer surfaces of the shell are $Q_{\text{int}} = 5\text{nC}$ and $Q_{\text{ext}} = 7\text{nC}$, respectively.

(a) Find the charge $Q_p$.
(b) Find the magnitude of the electric field $E$ at radius $r = 10\text{cm}$.
(c) Find the surface charge density $\sigma_{\text{int}}$ on the inner surface of the shell.
(d) Find the electric flux $\Phi_E$ through a Gaussian sphere of radius $r = 6\text{cm}$.

Solution:

(a) $Q_p = -Q_{\text{int}} = -5\text{nC}$.
(b) $E[4\pi(10\text{cm})^2] = \frac{Q_p + Q_{\text{int}} + Q_{\text{ext}}}{\epsilon_0} = \frac{Q_{\text{ext}}}{\epsilon_0}$
   $\Rightarrow E = 6300\text{N/C}$.
(c) $\sigma_{\text{int}} = \frac{Q_{\text{int}}}{4\pi(4\text{cm})^2} = 2.49 \times 10^{-7}\text{C/m}^2$.
(d) $\Phi_E = 0$ inside conducting material.
Consider a region of uniform electric field as shown. A charged particle is projected at time \( t = 0 \) with initial velocity as shown.

(a) Find the components \( a_x \) and \( a_y \) of the acceleration at time \( t = 0 \).
(b) Find the components \( v_x \) and \( v_y \) of the velocity at time \( t = 2s \).
(c) Find the kinetic energy at time \( t = 2s \).
(d) Sketch the path of the particle as it moves from the initial position.
Consider a region of uniform electric field as shown. A charged particle is projected at time $t = 0$ with initial velocity as shown.

(a) Find the components $a_x$ and $a_y$ of the acceleration at time $t = 0$.

(b) Find the components $v_x$ and $v_y$ of the velocity at time $t = 2s$.

(c) Find the kinetic energy at time $t = 2s$.

(d) Sketch the path of the particle as it moves from the initial position.

Solution:

(a) $a_x = 0$, $a_y = \frac{q}{m}E = \frac{3 \times 10^{-3} \text{C}}{7 \times 10^{-3} \text{kg}}(2 \text{N/C}) = 0.857 \text{m/s}^2$.

(b) $v_x = v_0 = 4 \text{m/s}$, $v_y = a_y t = (0.857 \text{m/s}^2)(2 \text{s}) = 1.71 \text{m/s}$.

(c) $E = \frac{1}{2}(7 \times 10^{-3} \text{kg})[(4 \text{m/s})^2 + (1.71 \text{m/s})^2] = 6.62 \times 10^{-2} \text{J}$.

(d) Upright parabolic path.
Consider two point charges positioned as shown.

(a) Find the magnitude of the electric force acting between the two charges.
(b) Find the electric potential at point $B$.
(c) Find the magnitude and direction of the electric field at point $A$. 

\begin{itemize}
  \item \textbf{Diagram:}
    \begin{itemize}
      \item Two point charges: $+9 \text{nC}$ and $+13 \text{nC}$.
      \item Distance between $B$ and $A$: 8m.
      \item Distance between $A$ and $C$: 5m.
      \item Distance between $B$ and $C$: 6m.
    \end{itemize}
\end{itemize}
Consider two point charges positioned as shown.

(a) Find the magnitude of the electric force acting between the two charges.
(b) Find the electric potential at point \( B \).
(c) Find the magnitude and direction of the electric field at point \( A \).

**Solution:**

(a) \[ F = k \frac{|(9\text{nC})(13\text{nC})|}{(10\text{m})^2} = 10.53\text{nN}. \]

(b) \[ V_B = k \frac{(9\text{nC})}{6\text{m}} + k \frac{(13\text{nC})}{8\text{m}} = 13.5\text{V} + 14.6\text{V} = 28.1\text{V}. \]

(c) \[ E_A = \left| k \frac{9\text{nC}}{(5\text{m})^2} - k \frac{13\text{nC}}{(5\text{m})^2} \right| = |3.24\text{N/C} - 4.68\text{N/C}| = 1.44\text{N/C}. \]

Direction along hypotenuse toward upper left.
The conducting spherical shell shown in cross section has a 4cm inner radius and an 8cm outer radius. The excess charges on its inner and outer surfaces are $Q_{\text{int}} = +7\text{nC}$ and $Q_{\text{ext}} = +11\text{nC}$, respectively. There is a point charge $Q_p$ at the center of the cavity.

(a) Find the point charge $Q_p$.
(b) Find the surface charge density $\sigma_{\text{int}}$ on the inner surface of the shell.
(c) Find the magnitude $E$ of the electric field at radius $r = 10\text{cm}$.
The conducting spherical shell shown in cross section has a 4cm inner radius and an 8cm outer radius. The excess charges on its inner and outer surfaces are $Q_{\text{int}} = +7\text{nC}$ and $Q_{\text{ext}} = +11\text{nC}$, respectively. There is a point charge $Q_p$ at the center of the cavity.

(a) Find the point charge $Q_p$.

(b) Find the surface charge density $\sigma_{\text{int}}$ on the inner surface of the shell.

(c) Find the magnitude $E$ of the electric field at radius $r = 10\text{cm}$.

Solution:

(a) $Q_p = -Q_{\text{int}} = -7\text{nC}$.

(b) $\sigma_{\text{int}} = \frac{Q_{\text{int}}}{4\pi(4\text{cm})^2} = 3.48 \times 10^{-7}\text{C/m}^2$.

(c) $E = \frac{k(11\text{nC})}{(10\text{cm})^2} = 9900\text{N/C}$. 
Consider a region of uniform electric field \( \mathbf{E} = -7\hat{i} \text{ N/C} \). At time \( t = 0 \) a charged particle (charge \( q = -5 \text{nC} \), mass \( m = 4 \times 10^{-6} \text{kg} \)) is released from rest at the origin of the coordinate system as shown.

(a) Find the acceleration, the velocity, and the position of the particle \( t = 0 \).
(b) Find the acceleration, the velocity, and the position of the particle at \( t = 3 \text{s} \).
(c) Find the work \( W \) done by the electric field on the particle between \( t = 0 \) and \( t = 3 \text{s} \).
Consider a region of uniform electric field $E = -7 \hat{i} \text{N/C}$. At time $t = 0$ a charged particle (charge $q = -5 \text{nC}$, mass $m = 4 \times 10^{-6} \text{kg}$) is released from rest at the origin of the coordinate system as shown.

(a) Find the acceleration, the velocity, and the position of the particle $t = 0$.

(b) Find the acceleration, the velocity, and the position of the particle at $t = 3 \text{s}$.

(c) Find the work $W$ done by the electric field on the particle between $t = 0$ and $t = 3 \text{s}$.

Solution:

(a) $a_x = \frac{(-5 \text{nC})}{4 \times 10^{-6} \text{kg}}(-7 \text{N/C}) = 8.75 \times 10^{-3} \text{m/s}^2$,

$v_x = 0, \quad x = 0$.

(b) $a_x = 8.75 \times 10^{-3} \text{m/s}^2$,

$v_x = a_xt = (8.75 \times 10^{-3} \text{m/s}^2)(3 \text{s}) = 2.63 \times 10^{-2} \text{m/s}$,

$x = \frac{1}{2}a_xt^2 = (0.5)(8.75 \times 10^{-3} \text{m/s}^2)(3 \text{s})^2 = 3.94 \times 10^{-2} \text{m}$.

(c) $W = F\Delta x = (-5 \text{nC})(-7 \text{N/C})(3.94 \times 10^{-2} \text{m}) = 1.38 \text{nJ}$.

$W = \Delta K = \frac{1}{2}(4 \times 10^{-6} \text{kg})(2.63 \times 10^{-2} \text{m/s})^2 = 1.38 \text{nJ}$. 
Consider two point charges positioned on the $x$-axis as shown.
(1a) Find magnitude and direction of the electric field at point C.
(1b) Find the electric potential at point B.
(2a) Find magnitude and direction of the electric field at point B.
(2b) Find the electric potential at point A.
Consider two point charges positioned on the $x$-axis as shown.

(1a) Find magnitude and direction of the electric field at point C.
(1b) Find the electric potential at point B.
(2a) Find magnitude and direction of the electric field at point B.
(2b) Find the electric potential at point A.

Solution:

(1a) $E_x = -k \frac{|-11nC|}{(7m)^2} + k \frac{|17nC|}{(2m)^2} = -2.02N/C + 38.25N/C = +36.23N/C.$

(1b) $V = k \frac{(-11nC)}{2m} + k \frac{(17nC)}{3m} = -49.5V + 51.0V = 1.5V.$

(2a) $E_x = -k \frac{|-11nC|}{(2m)^2} - k \frac{|17nC|}{(3m)^2} = -24.75N/C - 17.00N/C = -41.75N/C.$

(2b) $V = k \frac{(-11nC)}{3m} + k \frac{17nC}{8m} = -33.0V + 19.1V = -13.9V.$
Consider two plane surfaces (of rectangular and a circular shape) with area vectors $\vec{A}_1$ pointing in positive $z$-direction) and $\vec{A}_2$ pointing in positive $x$-direction. The region is filled with a uniform electric field

1. $\vec{E} = (4\hat{i} + 5\hat{j} - 7\hat{k})\text{N/C}$,
2. $\vec{E} = (-6\hat{i} + 4\hat{j} + 5\hat{k})\text{N/C}$.

(a) Find the electric flux $\Phi^{(1)}_E$ through area $A_1$.

(b) Find the electric flux $\Phi^{(2)}_E$ through area $A_2$. 

\[ \Phi^{(1)}_E = \vec{A}_1 \cdot \vec{E} \]
\[ \Phi^{(2)}_E = \vec{A}_2 \cdot \vec{E} \]
Consider two plane surfaces (of rectangular and a circular shape) with area vectors $\vec{A}_1$ pointing in positive $z$-direction) and $\vec{A}_2$ pointing in positive $x$-direction.

The region is filled with a uniform electric field

$(1) \quad \vec{E} = (4\hat{i} + 5\hat{j} - 7\hat{k}) \text{N/C},$

$(2) \quad \vec{E} = (-6\hat{i} + 4\hat{j} + 5\hat{k}) \text{N/C}.$

(a) Find the electric flux $\Phi_{E}^{(1)}$ through area $A_1$.
(b) Find the electric flux $\Phi_{E}^{(2)}$ through area $A_2$.

Solution:

$(1a) \quad \Phi_{E}^{(1)} = \vec{E} \cdot \vec{A}_1 = (-7 \text{N/C})(12.0 \text{m}^2) = -84.0 \text{Nm}^2/\text{C}.$

$(1b) \quad \Phi_{E}^{(2)} = \vec{E} \cdot \vec{A}_2 = (4 \text{N/C})(12.6 \text{m}^2) = 50.4 \text{Nm}^2/\text{C}.$

$(2a) \quad \Phi_{E}^{(1)} = \vec{E} \cdot \vec{A}_1 = (5 \text{N/C})(12.0 \text{m}^2) = 60.0 \text{Nm}^2/\text{C}.$

$(2b) \quad \Phi_{E}^{(2)} = \vec{E} \cdot \vec{A}_2 = (-6 \text{N/C})(12.6 \text{m}^2) = -75.6 \text{Nm}^2/\text{C}.$
Consider a region of space with a uniform electric field
(1) \( \mathbf{E} = 1.2 \text{V/m} \hat{j} \), (2) \( \mathbf{E} = 0.6 \text{V/m} \hat{i} \). Ignore gravity.

(a) If the electric potential vanishes at point 0, what are the electric potentials at points 1, 2, 3, 4?
(b) If a proton \((m = 1.67 \times 10^{-27} \text{kg}, q = 1.60 \times 10^{-19} \text{C})\) is released from rest at point 0, toward which point will it start moving?
(c) What will be the kinetic energy of the proton when it gets there?
Consider a region of space with a uniform electric field
(1) $E = 1.2\text{V/m} \hat{j}$,  (2) $E = 0.6\text{V/m} \hat{i}$. Ignore gravity.
(a) If the electric potential vanishes at point 0, what are the electric potentials at points 1, 2, 3, 4?
(b) If a proton ($m = 1.67 \times 10^{-27}\text{kg}$, $q = 1.60 \times 10^{-19}\text{C}$) is released from rest at point 0, toward which point will it start moving?
(c) What will be the kinetic energy of the proton when it gets there?

Solution:

(1a) $V_1 = 0$, $V_2 = -4.8\text{V}$, $V_3 = 0$, $V_4 = +4.8\text{V}$.
(1b) $F = qE$ (toward point 2).
(1c) $\Delta V = (V_2 - V_0) = -4.8\text{V}$,
$\Delta U = q\Delta V = -7.68 \times 10^{-19}\text{J}$,
$K = -\Delta U = +7.68 \times 10^{-19}\text{J}$.

(2a) $V_1 = 2.4\text{V}$, $V_2 = 0$, $V_3 = -2.4\text{V}$, $V_4 = 0$.
(2b) $F = qE$ (toward point 3).
(2c) $\Delta V = (V_3 - V_0) = -2.4\text{V}$,
$\Delta U = q\Delta V = -3.84 \times 10^{-19}\text{J}$,
$K = -\Delta U = +3.84 \times 10^{-19}\text{J}$.
Consider a pair of point charges in two different configurations. Find the electric potential $V$ and the components $E_x$ and $E_y$ of the electric field at point $A$ and at point $B$. 
Consider a pair of point charges in two different configurations. Find the electric potential $V$ and the components $E_x$ and $E_y$ of the electric field at point $A$ and at point $B$.

**Solution:**

- $V^{(A)} = k \frac{6 \text{nC}}{3 \text{cm}} + k \frac{(-5 \text{nC})}{4 \text{cm}} = 1800 \text{V} - 1125 \text{V} = 675 \text{V}$.

- $E_x^{(A)} = -k \frac{|6 \text{nC}|}{(3 \text{cm})^2} - k \frac{|-5 \text{nC}|}{(4 \text{cm})^2} = -88\ 125 \text{V/m}, \quad E_y^{(A)} = 0$.

- $V^{(B)} = k \frac{6 \text{nC}}{3 \text{cm}} + k \frac{5 \text{nC}}{4 \text{cm}} = 1800 \text{V} + 1125 \text{V} = 2925 \text{V}$.

- $E_x^{(B)} = k \frac{|5 \text{nC}|}{(4 \text{cm})^2} = 28\ 125 \text{V/m}, \quad E_y^{(B)} = -k \frac{|6 \text{nC}|}{(3 \text{cm})^2} = -60\ 000 \text{V/m}$.
A charged conducting spherical shell has a 4m inner radius and an 8m outer radius. The charge on the outer surface is \( Q_{\text{ext}} = -7 \text{nC} \).

(a) Find the charge \( Q_{\text{int}} \) on the inner surface of the shell.
(b) Find the surface charge density \( \sigma_{\text{ext}} \) on the outer surface of the shell.
(c) Find the magnitude of the electric field \( E \) at radius \( r = 6 \text{m} \).
(d) Find the electric flux \( \Phi_E \) through a Gaussian sphere of radius \( r = 10 \text{m} \).
(e) Find the magnitude of the electric field \( E \) at radius \( r = 10 \text{m} \).
A charged conducting spherical shell has a 4m inner radius and an 8m outer radius. The charge on the outer surface is \( Q_{\text{ext}} = -7 \text{nC} \).

(a) Find the charge \( Q_{\text{int}} \) on the inner surface of the shell.
(b) Find the surface charge density \( \sigma_{\text{ext}} \) on the outer surface of the shell.
(c) Find the magnitude of the electric field \( E \) at radius \( r = 6 \text{m} \).
(d) Find the electric flux \( \Phi_E \) through a Gaussian sphere of radius \( r = 10 \text{m} \).
(e) Find the magnitude of the electric field \( E \) at radius \( r = 10 \text{m} \).

**Solution:**

(a) \( Q_{\text{int}} = 0 \) (inferred from Gauss’ law.)

(b) \( \sigma_{\text{ext}} = \frac{-7 \text{nC}}{4\pi (8 \text{m})^2} = -8.70 \times 10^{-12} \text{C/m}^2 \).

(c) \( E = 0 \) (inside conducting material.)

(d) \( \Phi_E = \frac{-7 \text{nC}}{\varepsilon_0} = -791 \text{Nm}^2/\text{C} \).

(e) \( E = \frac{k | -7 \text{nC} |}{(10 \text{m})^2} = 0.63 \text{V/m} \).
Consider a region of uniform electric field as shown. A charged particle is released from rest at time $t = 0$ at the origin of the coordinate system.

(a) Find the acceleration $a_x$ of the particle at time $t = 3s$.
(b) Find the velocity $v_x$ of the particle at time $t = 3s$.
(c) Find the position $x$ of the particle at time $t = 3s$.
(d) In what time $\Delta t$ does the particle move from $x = 10m$ to $x = 20m$?

Given:
- Electric field $E = 6\text{N/C}$
- Mass $m = 5g$
- Charge $q = -4\text{mC}$
Consider a region of uniform electric field as shown. A charged particle is released from rest at time \( t = 0 \) at the origin of the coordinate system.

(a) Find the acceleration \( a_x \) of the particle at time \( t = 3 \) s.
(b) Find the velocity \( v_x \) of the particle at time \( t = 3 \) s.
(c) Find the position \( x \) of the particle at time \( t = 3 \) s.
(d) In what time \( \Delta t \) does the particle move from \( x = 10 \) m to \( x = 20 \) m?

**Solution:**

(a) \( a_x = \frac{q}{m} E = \frac{-4 \times 10^{-3} \text{C}}{5 \times 10^{-3} \text{kg}} (-6 \text{N/C}) = 4.8 \text{m/s}^2. \)

(b) \( v_x = a_x t = (4.8 \text{m/s}^2)(3 \text{s}) = 14.4 \text{m/s}. \)

(c) \( x = \frac{1}{2} a_x t^2 = 0.5(4.8 \text{m/s}^2)(3 \text{s})^2 = 21.6 \text{m}. \)

(d) \( \Delta t = \sqrt{\frac{2(20 \text{m})}{4.8 \text{m/s}^2}} - \sqrt{\frac{2(10 \text{m})}{4.8 \text{m/s}^2}} = 2.89\text{s} - 2.04\text{s} = 0.85\text{s}. \)
Consider two point charges positioned as shown.
(a) Find the magnitude of the electric field at point $C$ [$D$].
(b) Draw the field direction at point $C$ [$D$] by an arrow.
(c) Find the electric potential at point $A$ [$B$].
Consider two point charges positioned as shown.
(a) Find the magnitude of the electric field at point $C \ [D]$. 
(b) Draw the field direction at point $C \ [D]$ by an arrow.
(c) Find the electric potential at point $A \ [B]$.

**Solution:**

- $E_C = k \frac{9\text{nC}}{(4\text{m})^2} - k \frac{7\text{nC}}{(6\text{m})^2} = 5.06\text{V/m} - 1.75\text{V/m} = 3.31\text{V/m}.$

- $E_D = k \frac{7\text{nC}}{(3\text{m})^2} - k \frac{9\text{nC}}{(7\text{m})^2} = 7.00\text{V/m} - 1.65\text{V/m} = 5.35\text{V/m}.$

- Down/left along diagonal  [Up/right along diagonal].

- $V_A = k \frac{9\text{nC}}{6\text{m}} + k \frac{7\text{nC}}{8\text{m}} = 13.50\text{V} + 7.88\text{V} = 21.4\text{V}.$

- $V_B = k \frac{9\text{nC}}{8\text{m}} + k \frac{7\text{nC}}{6\text{m}} = 10.1\text{V} + 10.5\text{V} = 20.6\text{V}.$
Consider a conducting sphere and a conducting spherical shell as shown in cross section. The charges on the two surfaces of the shell are

\[ Q_2 = -5 \text{nC} \text{ and } Q_3 = +2 \text{nC} \] \[ Q_2 = +4 \text{nC} \text{ and } Q_3 = -3 \text{nC} \].

(a) Find the charge \( Q_1 \) on the surface of the conducting sphere.
(b) Find magnitude and direction of the electric field at point \( A \).
(c) Find magnitude and direction of the electric field at point \( B \).
Consider a conducting sphere and a conducting spherical shell as shown in cross section. The charges on the two surfaces of the shell are \( Q_2 = -5\text{nC} \) and \( Q_3 = +2\text{nC} \) \([Q_2 = +4\text{nC} \text{ and } Q_3 = -3\text{nC}]\).

(a) Find the charge \( Q_1 \) on the surface of the conducting sphere.
(b) Find magnitude and direction of the electric field at point \( A \).
(c) Find magnitude and direction of the electric field at point \( B \).

Solution:

(a) Gauss’ law implies that 
\[ Q_1 = -Q_2 = +5\text{nC} \quad [Q_1 = -Q_2 = -4\text{nC}] \]

(b) \[ E_A = k \frac{5\text{nC}}{(4\text{cm})^2} = 28.1 \times 10^3 \text{N/C} \quad \text{(right)} \]
\[ [E_A = k \frac{4\text{nC}}{(4\text{cm})^2} = 22.5 \times 10^3 \text{N/C} \quad \text{(left)}]. \]

(c) \[ E_B = k \frac{2\text{nC}}{(12\text{cm})^2} = 1.25 \times 10^3 \text{N/C} \quad \text{(right)} \]
\[ [E_B = k \frac{3\text{nC}}{(12\text{cm})^2} = 1.88 \times 10^3 \text{N/C} \quad \text{(left)}]. \]
Consider a region of uniform electric field $E$. A particle with charge $q$ and mass $m$ is projected at time $t = 0$ with initial velocity $v_0$. The specifications are $m = 3\text{g}$, $q = 2\text{mC}$, $v_0 = 4\text{m/s}$, $E = 5\text{N/C}$. [$m = 2\text{g}$, $q = 3\text{mC}$, $v_0 = 5\text{m/s}$, $E = 4\text{N/C}$]. Ignore gravity.

(a) Find the components $F_x$ and $F_y$ of the electric force acting on the particle at time $t = 1.5\text{s}$.

(b) Find the components $v_x$ and $v_y$ of the velocity at time $t = 1.5\text{s}$.

(c) Find the kinetic energy at time $t = 1.5\text{s}$.
Consider a region of uniform electric field $E$. A particle with charge $q$ and mass $m$ is projected at time $t = 0$ with initial velocity $v_0$. The specifications are $m = 3\text{g}$, $q = 2\text{mC}$, $v_0 = 4\text{m/s}$, $E = 5\text{N/C}$. [$m = 2\text{g}$, $q = 3\text{mC}$, $v_0 = 5\text{m/s}$, $E = 4\text{N/C}$]. Ignore gravity.

(a) Find the components $F_x$ and $F_y$ of the electric force acting on the particle at time $t = 1.5\text{s}$.

(b) Find the components $v_x$ and $v_y$ of the velocity at time $t = 1.5\text{s}$.

(c) Find the kinetic energy at time $t = 1.5\text{s}$.

**Solution:**

(a) $F_x = 0$, $F_y = qE = 10\text{mN}$

$b[F_x = 0$, $F_y = qE = 12\text{mN}]$.

(b) $v_x = v_0 = 4\text{m/s}$, $v_y = \frac{F_y}{m}t = 5\text{m/s}$

$[v_x = v_0 = 5\text{m/s}$, $v_y = \frac{F_y}{m}t = 9\text{m/s}]$.

(c) $K = \frac{1}{2}(3 \times 10^{-3}\text{kg})[(4\text{m/s})^2 + (5\text{m/s})^2] = 61.5\text{mJ}$

$[K = \frac{1}{2}(2 \times 10^{-3}\text{kg})[(5\text{m/s})^2 + (9\text{m/s})^2] = 106\text{mJ}]$. 
Point charges \( q_1 = +1 \text{nC}, q_2 = +2 \text{nC}, q_3 = -3 \text{nC} \) [\( q_1 = -1 \text{nC}, q_2 = +2 \text{nC}, q_3 = +3 \text{nC} \)] are positioned as shown.

(a) Find the components \( E_x \) and \( E_y \) of the electric field at point \( O \).

(b) Find the electric potential \( V \) at point \( O \).

(c) Find the direction (\( \uparrow, \nearrow, \rightarrow, \searrow, \downarrow, \swarrow, \leftarrow, \nwarrow \)) of the resultant Coulomb force on charge \( q_2 \).
Point charges $q_1 = +1\text{nC}$, $q_2 = +2\text{nC}$, $q_3 = -3\text{nC}$ are positioned as shown.

(a) Find the components $E_x$ and $E_y$ of the electric field at point $O$.
(b) Find the electric potential $V$ at point $O$.
(c) Find the direction ($\uparrow$, $\nearrow$, $\rightarrow$, $\searrow$, $\swarrow$, $\leftarrow$, $\nwarrow$) of the resultant Coulomb force on charge $q_2$.

Solution:

(a) $E_x = -k \frac{|q_2|}{(3m)^2} + k \frac{|q_3|}{(5m)^2} = -0.92 \text{ N/C}$

$$
E_x = -k \frac{|q_2|}{(3m)^2} - k \frac{|q_3|}{(5m)^2} = -3.08 \text{ N/C}
$$

$E_y = -k \frac{|q_1|}{(4m)^2} = -0.56 \text{ N/C}$

$$
E_y = +k \frac{|q_1|}{(4m)^2} = +0.56 \text{ N/C}
$$

(b) $V = k \frac{q_1}{4m} + k \frac{q_2}{3m} + k \frac{q_3}{5m} = 2.85\text{V}$

$$
V = k \frac{q_1}{4m} + k \frac{q_2}{3m} + k \frac{q_3}{5m} = 9.15\text{V}
$$

(c) $\searrow$ $[\searrow]$
Consider a Gaussian surface in the form of a cube with edges of length 3m placed into a region of uniform electric field \( \mathbf{E} = (5\mathbf{i} - 4\mathbf{j} + 6\mathbf{k}) \text{N/C} [\mathbf{E} = (8\mathbf{i} + 7\mathbf{j} - 9\mathbf{k}) \text{N/C}]$. 

(a) Find the electric flux \( \Phi^{(1)}_{\mathbf{E}} \) through face 1 (in \( xy \) plane).

(b) Find the electric flux \( \Phi^{(2)}_{\mathbf{E}} \) through face 2 (in \( xz \) plane).

(c) Find the electric flux \( \Phi^{(3)}_{\mathbf{E}} \) through face 3 (in \( yz \) plane).

(d) Find the electric flux \( \Phi^{(\text{tot})}_{\mathbf{E}} \) through all six faces added up.
Consider a Gaussian surface in the form of a cube with edges of length 3m placed into a region of uniform electric field $\mathbf{E} = (5\hat{i} - 4\hat{j} + 6\hat{k})\text{N/C}$ [$\mathbf{E} = (8\hat{i} + 7\hat{j} - 9\hat{k})\text{N/C}$].

(a) Find the electric flux $\Phi_{E}^{(1)}$ through face 1 (in $xy$ plane).

(b) Find the electric flux $\Phi_{E}^{(2)}$ through face 2 (in $xz$ plane).

(c) Find the electric flux $\Phi_{E}^{(3)}$ through face 3 (in $yz$ plane).

(d) Find the electric flux $\Phi_{E}^{(tot)}$ through all six faces added up.

**Solution:**

(a) $\Phi_{E}^{(1)} = \mathbf{E} \cdot \mathbf{A}_1 = (6\text{N/C})\hat{k} \cdot (-9m^2)\hat{k} = -54\text{Nm}^2/\text{C}$

$[\Phi_{E}^{(1)} = \mathbf{E} \cdot \mathbf{A}_1 = (-9\text{N/C})\hat{k} \cdot (-9m^2)\hat{k} = 81\text{Nm}^2/\text{C}]$

(b) $\Phi_{E}^{(2)} = \mathbf{E} \cdot \mathbf{A}_2 = (-4\text{N/C})\hat{j} \cdot (-9m^2)\hat{j} = +36\text{Nm}^2/\text{C}$

$[\Phi_{E}^{(2)} = \mathbf{E} \cdot \mathbf{A}_2 = (7\text{N/C})\hat{j} \cdot (-9m^2)\hat{j} = -63\text{Nm}^2/\text{C}]$

(c) $\Phi_{E}^{(3)} = \mathbf{E} \cdot \mathbf{A}_3 = (5\text{N/C})\hat{i} \cdot (-9m^2)\hat{i} = -45\text{Nm}^2/\text{C}$

$[\Phi_{E}^{(3)} = \mathbf{E} \cdot \mathbf{A}_3 = (8\text{N/C})\hat{i} \cdot (-9m^2)\hat{i} = -72\text{Nm}^2/\text{C}]$

(d) $\Phi_{E}^{(tot)} = \frac{Q_{in}}{\varepsilon_0} = 0 \quad [\Phi_{E}^{(tot)} = \frac{Q_{in}}{\varepsilon_0} = 0]$
Consider a region of uniform electric field \( \mathbf{E} = -2 \text{N/C} \hat{i} \) [\( \mathbf{E} = -3 \text{N/C} \hat{i} \)]. A charged particle (\( m = 0.04 \text{kg}, q = 6 \text{mC} \)) [(\( m = 0.05 \text{kg}, q = 7 \text{mC} \))] is projected at time \( t = 0 \) with initial velocity \( \mathbf{v}_0 = 8 \text{m/s} \hat{i} \) [\( \mathbf{v}_0 = 9 \text{m/s} \hat{i} \)] from the origin of the coordinate system as shown.

(a) Find the the acceleration \( a_x \) of the particle at time \( t = 2.5 \text{s} \).
(b) Find its velocity \( v_x \) at time \( t = 2.5 \text{s} \).
(c) Find its position \( x \) at time \( t = 2.5 \text{s} \).
Consider a region of uniform electric field \( \mathbf{E} = -2 \text{N/C} \hat{i} \) [\( \mathbf{E} = -3 \text{N/C} \hat{i} \)]. A charged particle \((m = 0.04\text{kg}, \ q = 6\text{mC})\) [(\(m = 0.05\text{kg}, \ q = 7\text{mC})\)] is projected at time \( t = 0 \) with initial velocity \( \mathbf{v}_0 = 8\text{m/s} \hat{i} \) [\( \mathbf{v}_0 = 9\text{m/s} \hat{i} \)] from the origin of the coordinate system as shown.

(a) Find the acceleration \( a_x \) of the particle at time \( t = 2.5\text{s} \).
(b) Find its velocity \( v_x \) at time \( t = 2.5\text{s} \).
(c) Find its position \( x \) at time \( t = 2.5\text{s} \).

Solution:

(a) \[ a_x = -\frac{q}{m} \mathbf{E} = -\frac{6 \times 10^{-3} \text{C}}{4 \times 10^{-2} \text{kg}} (2 \text{N/C}) = -0.3 \text{m/s}^2 \]

\[ a_x = -\frac{7 \times 10^{-3} \text{C}}{5 \times 10^{-2} \text{kg}} (3 \text{N/C}) = -0.42 \text{m/s}^2 \]

(b) \[ v_x = v_0 + a_x t = 8\text{m/s} - (0.3\text{m/s}^2)(2.5\text{s}) = 7.25\text{m/s} \]

\[ v_x = v_0 + a_x t = 9\text{m/s} - (0.42\text{m/s}^2)(2.5\text{s}) = 7.95\text{m/s} \]

(c) \[ x = v_0 t + \frac{1}{2} a_x t^2 = (8\text{m/s})(2.5\text{s}) - 0.5(0.3\text{m/s}^2)(2.5\text{s})^2 = 19.1\text{m} \]

\[ x = v_0 t + \frac{1}{2} a_x t^2 = (9\text{m/s})(2.5\text{s}) - 0.5(0.42\text{m/s}^2)(2.5\text{s})^2 = 21.2\text{m} \]
Consider point charges positioned in two coordinate systems as shown.

- Find the electric field $E_A$ at point $A$.
- Find the electric field $E_B$ at point $B$.
- Find the electric potential $V_A$ at point $A$.
- Find the electric potential $V_B$ at point $B$. 

![Diagram of point charges with coordinates and charges labeled]
Consider point charges positioned in two coordinate systems as shown.

- Find the electric field $E_A$ at point $A$.
- Find the electric field $E_B$ at point $B$.
- Find the electric potential $V_A$ at point $A$.
- Find the electric potential $V_B$ at point $B$.

**Solution:**

$$E_A = 2k \frac{|2nC|}{(6cm)^2} \hat{i} = 1.00 \times 10^4 \text{ N/C} \hat{i}$$

$$E_B = -2k \frac{|5nC|}{(6cm)^2} \hat{j} = -2.50 \times 10^4 \text{ N/C} \hat{j}$$

$$V_A = 2k \frac{3nC}{6cm} = 9.00 \times 10^2 \text{ V}$$

$$V_B = 2k \frac{(-4nC)}{6cm} = -12.0 \times 10^2 \text{ V}$$
Consider a long charged rod with charge per unit length $\lambda = 3 \mu C/m \ [\lambda = 2 \mu C/m]$. A Gaussian cylinder of radius $R = 4 \text{cm} \ [R = 5 \text{cm}]$ and length $L = 12 \text{cm} \ [L = 15 \text{cm}]$ is placed with its axis along the rod as shown.

(a) Find the area $A$ of the Gaussian cylinder.
(b) Find the electric charge $Q_{in}$ inside the cylinder.
(c) Find the electric flux $\Phi_E$ through the Gaussian cylinder.
Consider a long charged rod with charge per unit length $\lambda = 3 \mu C/m$ [$\lambda = 2 \mu C/m$]. A Gaussian cylinder of radius $R = 4\text{cm}$ [$R = 5\text{cm}$] and length $L = 12\text{cm}$ [$L = 15\text{cm}$] is placed with its axis along the rod as shown.

(a) Find the area $A$ of the Gaussian cylinder.
(b) Find the electric charge $Q_{in}$ inside the cylinder.
(c) Find the electric flux $\Phi_E$ through the Gaussian cylinder.

**Solution:**

(a) $A = 2 \times \pi (4\text{cm})^2 + 2\pi (4\text{cm})(12\text{cm}) = 4.03 \times 10^{-2}\text{m}^2$

[ $A = 2 \times \pi (5\text{cm})^2 + 2\pi (5\text{cm})(15\text{cm}) = 6.28 \times 10^{-2}\text{m}^2$]

(b) $Q_{in} = \lambda L = (3\mu C/m)(12\text{cm}) = 0.36\mu C$  

[ $Q_{in} = \lambda L = (2\mu C/m)(15\text{cm}) = 0.30\mu C$]

(c) $\Phi_E = \frac{Q_{in}}{\epsilon_0} = 4.07 \times 10^4\text{Nm}^2/\text{C}$  

[ $\Phi_E = \frac{Q_{in}}{\epsilon_0} = 3.39 \times 10^4\text{Nm}^2/\text{C}$]
In a region of uniform electric field \( \mathbf{E} = 9 \text{N/C} \hat{i} + 7 \text{N/C} \hat{j} \), a charged particle \((m = 0.02 \text{kg}, \ q = 4 \text{mC})\) is projected at time \( t = 0 \) with initial speed \( v_0 = 6 \text{m/s} \) in the direction shown. If we write \( \mathbf{a} = a_x \hat{i} + a_y \hat{j} \) for the acceleration and \( \mathbf{v}(t) = v_x(t) \hat{i} + v_y(t) \hat{j} \) for the velocity of the particle ...

(a) find \( a_x \) and \( a_y \),
(b) find \( v_x(0) \) and \( v_y(0) \),
(c) find \( v_x(6 \text{s}) \) and \( v_y(6 \text{s}) \).
In a region of uniform electric field $\mathbf{E} = 9\text{N/C} \hat{i} + 7\text{N/C} \hat{j}$, a charged particle $(m = 0.02\text{kg}, \ q = 4\text{mC})$ is projected at time $t = 0$ with initial speed $v_0 = 6\text{m/s}$ in the direction shown. If we write $\mathbf{a} = a_x \hat{i} + a_y \hat{j}$ for the acceleration and $\mathbf{v}(t) = v_x(t) \hat{i} + v_y(t) \hat{j}$ for the velocity of the particle ... 

(a) find $a_x$ and $a_y$,  
(b) find $v_x(0)$ and $v_y(0)$,  
(c) find $v_x(6\text{s})$ and $v_y(6\text{s})$.

Solution:

(a) $a_x = \frac{4 \times 10^{-3}\text{C}}{2 \times 10^{-2}\text{kg}} (9\text{N/C}) = 1.80\text{m/s}^2$.  
(a) $a_y = \frac{4 \times 10^{-3}\text{C}}{2 \times 10^{-2}\text{kg}} (7\text{N/C}) = 1.40\text{m/s}^2$. 

(b) $v_x(0) = v_0 \cos 35^\circ = (6\text{m/s})(0.819) = 4.91\text{m/s}$.  
(b) $v_y(0) = v_0 \sin 35^\circ = (6\text{m/s})(0.574) = 3.44\text{m/s}$.  

(c) $v_x(6\text{s}) = 4.91\text{m/s} + (1.80\text{m/s}^2)(6\text{s}) = 15.7\text{m/s}$.  
(c) $v_y(6\text{s}) = 3.44\text{m/s} + (1.40\text{m/s}^2)(6\text{s}) = 11.8\text{m/s}$.
Consider the three point charges surrounding point A or point B. Find the electric field $E_A$ at point A and $E_B$ at point B. Find the electric potential $V_A$ at point A and $V_B$ at point B. Find the magnitude $F_{23}$ between the two positive charges on the left and $F_{35}$ between the two positive charges on the right.
Consider the three point charges surrounding point A or point B.
Find the electric field \( E_A \) at point A and \( E_B \) at point B.
Find the electric potential \( V_A \) at point A and \( V_B \) at point B.
Find the magnitude \( F_{23} \) between the two positive charges on the left and \( F_{35} \) between the two positive charges on the right.

Solution:

- \( E_A = k \frac{|2nC|}{(8cm)^2} \hat{i} + k \frac{|4nC|}{(8cm)^2} \hat{i} - k \frac{|3nC|}{(8cm)^2} \hat{j} = 8.44 \times 10^3 \text{ N/C} \hat{i} - 4.22 \times 10^3 \text{ N/C} \hat{j} \)
- \( E_B = k \frac{|3nC|}{(8cm)^2} \hat{i} + k \frac{|6nC|}{(8cm)^2} \hat{i} - k \frac{|5nC|}{(8cm)^2} \hat{j} = 12.7 \times 10^3 \text{ N/C} \hat{i} - 7.03 \times 10^3 \text{ N/C} \hat{j} \)
- \( V_A = k \frac{2nC}{8cm} + k \frac{3nC}{8cm} - k \frac{4nC}{8cm} = 113 \text{ V}, \quad V_B = k \frac{3nC}{8cm} + k \frac{5nC}{8cm} - k \frac{6nC}{8cm} = 225 \text{ V} \)
- \( F_{23} = k \frac{|(2nC)(3nC)|}{(8cm)^2 + (8cm)^2} = 4.22 \times 10^{-6} \text{ N}, \quad F_{35} = k \frac{|(3nC)(5nC)|}{(8cm)^2 + (8cm)^2} = 10.5 \times 10^{-6} \text{ N} \)
The conducting spherical shell with no net charge on it has a 2m inner radius and a 4m outer radius. There is a point charge $Q_p = -4 \text{nC}$ [$Q_p = 5 \text{nC}$] at the center.

(a) Find the charges $Q_{\text{int}}$ and $Q_{\text{ext}}$ on the two surfaces of the shell.
(b) Find the electric flux $\Phi_E$ through a Gaussian sphere of $r = 1\text{m}$.
(c) Find magnitude and direction of the electric field at $r = 5\text{m}$. 

![Diagram of a conducting spherical shell with a point charge at the center, showing the inner radius, outer radius, and Gaussian sphere.]
The conducting spherical shell with no net charge on it has a 2m inner radius and a 4m outer radius. There is a point charge $Q_p = -4 \text{nC} \ [Q_p = 5 \text{nC}]$ at the center.

(a) Find the charges $Q_{\text{int}}$ and $Q_{\text{ext}}$ on the two surfaces of the shell.
(b) Find the electric flux $\Phi_E$ through a Gaussian sphere of $r = 1 \text{m}$.
(c) Find magnitude and direction of the electric field at $r = 5 \text{m}$.

**Solution:**

(a) $Q_{\text{int}} = +4 \text{nC}$, $Q_{\text{ext}} = -4 \text{nC}$, $[Q_{\text{int}} = -5 \text{nC}, \ Q_{\text{ext}} = +5 \text{nC}]$.

(b) $\Phi_E = \frac{Q_p}{\epsilon_0} = -452 \text{Nm}^2/\text{C}$,

$$\Phi_E = \frac{Q_p}{\epsilon_0} = +565 \text{Nm}^2/\text{C}.$$  

(c) $4\pi(5m)^2E = \frac{(Q_p + Q_{\text{int}} + Q_{\text{ext}})}{\epsilon_0} < 0 \ \Rightarrow \ E = -1.44 \text{N/C} \ \text{(inward)},$

$$4\pi(5m)^2E = \frac{(Q_p + Q_{\text{int}} + Q_{\text{ext}})}{\epsilon_0} > 0 \ \Rightarrow \ E = +1.80 \text{N/C} \ \text{(outward)}.$$
In a region of uniform electric field, \( \mathbf{E} = 5\text{N/C} \hat{i} + 4\text{N/C} \hat{j} \), a charged particle 
\((m = 0.03\text{kg}, q = 2\text{mC})\) \([\(m = 0.02\text{kg}, q = 3\text{mC}\)]\) is released from rest at time \( t = 0 \) at the origin of the coordinate system.

(a) Find the electric force \( \mathbf{F} = F_x \hat{i} + F_y \hat{j} \) acting on the particle.

(b) Find the position \( \mathbf{r} = x \hat{i} + y \hat{j} \) of the particle at time \( t = 7\text{s} \).

(c) Draw the shape of the path into the diagram.
In a region of uniform electric field, \( E = 5 \text{N/C} \hat{i} + 4 \text{N/C} \hat{j} \), a charged particle \((m = 0.03 \text{kg}, \ q = 2 \text{mC})\) \([(m = 0.02 \text{kg}, \ q = 3 \text{mC})\]) is released from rest at time \( t = 0 \) at the origin of the coordinate system.

(a) Find the electric force \( \mathbf{F} = F_x \hat{i} + F_y \hat{j} \) acting on the particle.
(b) Find the position \( \mathbf{r} = x \hat{i} + y \hat{j} \) of the particle at time \( t = 7 \text{s} \).
(c) Draw the shape of the path into the diagram.

**Solution:**

(a) \( F_x = (2 \times 10^{-3} \text{C})(5 \text{N/C}) = 10 \times 10^{-3} \text{N}, \quad F_y = (2 \times 10^{-3} \text{C})(4 \text{N/C}) = 8 \times 10^{-3} \text{N}. \)

\[ F_x = (3 \times 10^{-3} \text{C})(5 \text{N/C}) = 15 \times 10^{-3} \text{N}, \quad F_y = (3 \times 10^{-3} \text{C})(4 \text{N/C}) = 12 \times 10^{-3} \text{N}. \]

(b) \( x = \frac{1}{2} \left( \frac{10 \times 10^{-3} \text{N}}{3 \times 10^{-2} \text{kg}} \right) (7 \text{s})^2 = 8.17 \text{m}, \quad y = \frac{1}{2} \left( \frac{8 \times 10^{-3} \text{N}}{3 \times 10^{-2} \text{kg}} \right) (7 \text{s})^2 = 6.53 \text{m}. \)

\[ x = \frac{1}{2} \left( \frac{15 \times 10^{-3} \text{N}}{2 \times 10^{-2} \text{kg}} \right) (7 \text{s})^2 = 18.4 \text{m}, \quad y = \frac{1}{2} \left( \frac{12 \times 10^{-3} \text{N}}{2 \times 10^{-2} \text{kg}} \right) (7 \text{s})^2 = 14.7 \text{m}. \]

(c) Straight line through origin parallel to direction of electric field.
Consider two point charges positioned on a circle as shown left and right. 
(a) Find the horizontal component $E_x$ of the electric field at points A and B. 
(b) Find the vertical component $E_y$ of the electric field at points A and B. 
(c) Find the electric potential $V$ at points A and B.
Consider two point charges positioned on a circle as shown left and right.
(a) Find the horizontal component $E_x$ of the electric field at points A and B.
(b) Find the vertical component $E_y$ of the electric field at points A and B.
(c) Find the electric potential $V$ at points A and B.

Solution:

(a) $E_x = k \frac{8 \text{nC}}{(2 \text{m})^2} - k \frac{7 \text{nC}}{(2 \text{m})^2} \cos 40^\circ = 5.9 \text{N/C}$

(b) $E_y = -k \frac{7 \text{nC}}{(2 \text{m})^2} \sin 40^\circ = -10.1 \text{N/C}$

(c) $V = k \frac{8 \text{nC}}{2 \text{m}} + k \frac{7 \text{nC}}{2 \text{m}} = 67.5 \text{V}$.

$E_x = k \frac{6 \text{nC}}{(2 \text{m})^2} \cos 50^\circ - k \frac{5 \text{nC}}{(2 \text{m})^2} = -2.57 \text{N/C}$

$E_y = -k \frac{6 \text{nC}}{(2 \text{m})^2} \sin 50^\circ = -10.4 \text{N/C}$

$V = k \frac{6 \text{nC}}{2 \text{m}} + k \frac{5 \text{nC}}{2 \text{m}} = 49.5 \text{V}$.
Two oppositely charged plates positioned as shown produce between them a uniform electric field \( E = 1.4 \text{N/C} \) in the direction shown. A proton \((m = 1.67 \times 10^{-27} \text{kg}, \  q = 1.60 \times 10^{-19} \text{C})\) is launched at \( x = 0 \) with initial velocity \( v_0 = 3.5 \times 10^4 \text{m/s} \) \([v_0 = 4.2 \times 10^4 \text{m/s}]\) as shown. The proton enters and exits the region of electric field through holes in the plates.

(a) At what time after launch does the proton reach the first plate?
(b) What is the acceleration of the proton between the plates?
(c) What is the potential difference between the plates?
(d) Does the proton gain or lose kinetic energy as it travels between the plates?
(e) What is the amount \(\Delta K\) of gain or loss?
Two oppositely charged plates positioned as shown produce between them a uniform electric field $E = 1.4 \text{N/C}$ [$E = 2.3 \text{N/C}$] in the direction shown. A proton ($m = 1.67 \times 10^{-27} \text{kg}$, $q = 1.60 \times 10^{-19} \text{C}$) is launched at $x = 0$ with initial velocity $v_0 = 3.5 \times 10^4 \text{m/s}$ [$v_0 = 4.2 \times 10^4 \text{m/s}$] as shown. The proton enters and exits the region of electric field through holes in the plates.

(a) At what time after launch does the proton reach the first plate?
(b) What is the acceleration of the proton between the plates?
(c) What is the potential difference between the plates?
(d) Does the proton gain or lose kinetic energy as it travels between the plates?
(e) What is the amount $\Delta K$ of gain or loss?

Solution:

(a) $t = \frac{(2m)}{v_0} = 5.71 \times 10^{-5} \text{s}$ [$4.76 \times 10^{-5} \text{s}$].

(b) $a = -\frac{qE}{m} = -1.34 \times 10^8 \text{m/s}^2$ [$-2.20 \times 10^8 \text{m/s}^2$].

(c) $|\Delta V| = E(1.5\text{m}) = 2.1 \text{V}$ [$3.45 \text{V}$].

(d) loss

(e) $\Delta K = -q|\Delta V| = -3.36 \times 10^{-19} \text{J}$ [$-5.52 \times 10^{-19} \text{J}$].
A point charge $Q_p = 7\text{nC}$ [$Q_p = 8\text{nC}$] is surrounded by a conducting spherical shell with a 2m inner radius and a 4m outer radius. There is zero net charge on the shell.

(a) What is the magnitude of the electric field $E$ at radius $r = 1\text{m}$?
(b) What is the charge $Q_{\text{int}}$ on the inner surface of the shell?
(c) What is the magnitude of the electric field $E$ at radius $r = 3\text{m}$?
(d) What is the charge $Q_{\text{ext}}$ on the outer surface of the shell?
(e) What is the electric flux $\Phi_E$ through a Gaussian sphere of radius $r = 5\text{m}$.
A point charge $Q_p = 7 \text{nC} \ [Q_p = 8 \text{nC}]$ is surrounded by a conducting spherical shell with a 2m inner radius and a 4m outer radius. There is zero net charge on the shell. 

(a) What is the magnitude of the electric field $E$ at radius $r = 1 \text{m}$?

(b) What is the charge $Q_{\text{int}}$ on the inner surface of the shell?

(c) What is the magnitude of the electric field $E$ at radius $r = 3 \text{m}$?

(d) What is the charge $Q_{\text{ext}}$ on the outer surface of the shell?

(e) What is the electric flux $\Phi_E$ through a Gaussian sphere of radius $r = 5 \text{m}$.

Solution:

(a) $E = \frac{kQ_p}{(1 \text{m})^2} = 63 \text{N/C} \ [72 \text{N/C}]$.

(b) $Q_{\text{int}} = -Q_p = -7 \text{nC} \ [-8 \text{nC}]$.

(c) $E = 0$.

(d) $Q_{\text{ext}} = -Q_{\text{int}} = +7 \text{nC} \ [+8 \text{nC}]$.

(e) $\Phi_E = \frac{Q_p}{\epsilon_0} = 791 \text{Nm}^2/\text{C} \ [904 \text{Nm}^2/\text{C}]$. 
Consider two point charges positioned as shown. Use $k = 9 \times 10^9 \text{Nm}^2/\text{C}^2$.

(a) Find the electric field $\mathbf{E} = E_x \hat{i} + E_y \hat{j}$ at point O.
(b) Find the electric potential $V$ at point O.
(c) Find the magnitude $F$ of the force between the two charges.

\[ \begin{align*}
\text{Charge} & \quad \text{Position} \\
+2\text{nC} & \quad (0, 3m) \\
-4\text{nC} & \quad (4m, 0) \\
\end{align*} \]
Consider two point charges positioned as shown. Use \( k = 9 \times 10^9 \text{ Nm}^2/\text{C}^2 \).

(a) Find the electric field \( \mathbf{E} = E_x \hat{i} + E_y \hat{j} \) at point O.

(b) Find the electric potential \( V \) at point O.

(c) Find the magnitude \( F \) of the force between the two charges.

**Solution:**

(a) \( E_x = k \frac{|-4 \text{nC}|}{(4\text{m})^2} = \frac{9}{4} \text{ N/C} = 2.25 \text{ N/C}, \quad E_y = k \frac{|2 \text{nC}|}{(3\text{m})^2} = 2 \text{ N/C}. \)

(b) \( V = k \frac{(-4 \text{nC})}{4\text{m}} + k \frac{2 \text{nC}}{3\text{m}} = -9V + 6V = -3V. \)

(c) \( F = k \frac{|(-4 \text{nC})(2 \text{nC})|}{(5\text{m})^2} = \frac{72}{25} \text{nN} = 2.88 \text{nN} \)
Consider three plane surfaces (two squares, one odd shape) with area vectors $\mathbf{A}_1$ (in positive $x$-direction), $\mathbf{A}_2$ (in negative $z$-direction), and $\mathbf{A}_3$ (in positive $y$-direction). The region is filled with a uniform electric field $\mathbf{E} = (2\mathbf{i} + 3\mathbf{j} + 4\mathbf{k})\text{N/C}$. The electric flux through surface 3 is $\Phi_E^{(3)} = 21\text{Nm}^2/\text{C}$.

(a) Find the electric flux $\Phi_E^{(1)}$ through surface 1.

(b) Find the electric flux $\Phi_E^{(2)}$ through surface 2.

(c) Find the area vector $\mathbf{A}_3$ of surface 3.
Consider three plane surfaces (two squares, one odd shape) with area vectors $A_1$ (in positive $x$-direction), $A_2$ (in negative $z$-direction), and $A_3$ (in positive $y$-direction). The region is filled with a uniform electric field $\mathbf{E} = (2\hat{i} + 3\hat{j} + 4\hat{k})\text{N/C}$. The electric flux through surface 3 is $\Phi_E^{(3)} = 21\text{Nm}^2/\text{C}$.

(a) Find the electric flux $\Phi_E^{(1)}$ through surface 1.

(b) Find the electric flux $\Phi_E^{(2)}$ through surface 2.

(c) Find the area vector $A_3$ of surface 3.

Solution:

(a) $A_1 = 9m^2\hat{i}$, $\Phi_E^{(1)} = \mathbf{E} \cdot A_1 = (2\text{N/C})(9m^2) = 18\text{Nm}^2/\text{C}$.

(b) $A_2 = -9m^2\hat{k}$, $\Phi_E^{(2)} = \mathbf{E} \cdot A_2 = -(4\text{N/C})(9m^2) = -36\text{Nm}^2/\text{C}$.

(c) $A_3 = A_3\hat{j}$, $\Phi_E^{(3)} = A_3(3\text{N/C}) = 21\text{Nm}^2/\text{C}$ $\Rightarrow A_3 = 7m^2$. 
Consider a region of uniform electric field $\mathbf{E} = 3\text{N/C}\hat{i}$. A charged particle ($m = 2\text{kg}, \, q = 4\text{C}$) is projected at time $t = 0$ with initial velocity $\mathbf{v}_0 = 5\text{m/s}\hat{j}$ from the position shown.

(a) Find the acceleration $\mathbf{a} = a_x \hat{i} + a_y \hat{j}$ of the particle at time $t = 3\text{s}$.

(b) Find its velocity $\mathbf{v} = v_x \hat{i} + v_y \hat{j}$ at time $t = 3\text{s}$.

(c) Find its position $\mathbf{r} = x \hat{i} + y \hat{j}$ at time $t = 3\text{s}$. 

\[
\begin{align*}
\text{(a) } a_x &= \frac{qE}{m} \sin\theta \\
\text{(b) } v_x &= v_0 \cos\theta \\
\text{(c) } x &= v_0 \cos\theta \cdot t \\
\text{(c) } y &= v_0 \sin\theta \cdot t + \frac{1}{2} a_y t^2 
\end{align*}
\]
Consider a region of uniform electric field \( \mathbf{E} = 3\text{N/C}\hat{i} \). A charged particle \((m = 2\text{kg}, q = 4\text{C})\) is projected at time \(t = 0\) with initial velocity \(\mathbf{v}_0 = 5\text{m/s}\hat{j}\) from the position shown.

(a) Find the acceleration \(\mathbf{a} = a_x \hat{i} + a_y \hat{j}\) of the particle at time \(t = 3\text{s}\).
(b) Find its velocity \(\mathbf{v} = v_x \hat{i} + v_y \hat{j}\) at time \(t = 3\text{s}\).
(c) Find its position \(\mathbf{r} = x \hat{i} + y \hat{j}\) at time \(t = 3\text{s}\).

Solution:

(a) \(a_x = \frac{q}{m} E = \frac{4\text{C}}{2\text{kg}} (3\text{N/C}) = 6\text{m/s}^2, \quad a_y = 0.\)

(b) \(v_x = a_x t = (6\text{m/s}^2)(3\text{s}) = 18\text{m/s}, \quad v_y = v_0 = 5\text{m/s}.\)

(c) \(x = x_0 + \frac{1}{2}a_x t^2 = 2\text{m} + 0.5(6\text{m/s}^2)(3\text{s})^2 = 29\text{m}, \quad y = v_0 t = (5\text{m/s})(3\text{s}) = 15\text{m}.\)
