* March and April files may contain inaccuracies. Log files were deleted in March 1999, possibly by a hacker. April statistics began on the 6th of the month.

*DEFINITIONS

Requests

A request occurs when a web server is asked to provide a page, graphic or other object. This is frequently called a Hit. Requests may be generated either by visitor going to a page or by the page itself requesting an object (usually a graphic). Using the number of requests to gauge the popularity of a site can be misleading because pages with lots of embedded graphics can generate many more requests than sites with simpler graphics. For that reason, the number of visits or the number of HTML page requests will probably give a more accurate activity picture.

Page Requests

A page request occurs when a web server is asked to provide an HTML file, i.e. a web page. This is a more accurate measure of activity than requests, since it excludes requests for graphics that are embedded in pages.

Visitors

A visitor is usually defined simply as a unique IP address. A particular IP address may represent a unique person but, more often, one IP is shared by many people.

Visits

A visit is a collection of requests that represent all the pages and graphics seen by a particular visitor at one time. The total number of visits is usually more than the total number of visitors because each visitor can visit the site more than once. Visits are just estimates because there is no way to be certain that a series of requests actually belongs to the same person, or, for that matter, to the same person during the same visit.
