Hall Effect

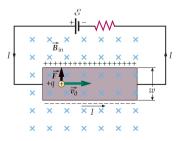

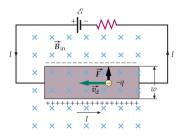

Method for dermining whether charge carriers are positively or negatively charged.

- Magnetic field \vec{B} pulls charge carriers to one side of conducting strip.
- Accumulation of charge carriers on that side and depletion on opposite side produce transverse electric field \vec{E} .
- Transverse forces on charge carrier: $F_E = qE$ and $F_B = qv_d B$.
- In steady state forces are balanced: $\vec{F}_E = -\vec{F}_B$.

- (a) Find the horizontal velocity components v_{Ex} , v_{Bx} and the vertical velocity components v_{Ey} , v_{By} at the instant each particle hits the wall.
- (b) Find the times t_E , t_B it takes each particle to reach the wall.

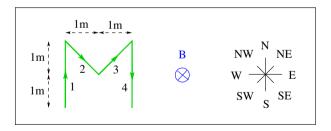

Magnetic Force Application (12)

An electric current I = 1A flows through the M-shaped wire in the direction indicated. The wire is placed in a magnetic field B = 1T pointing into the plane.

- (a) Find the magnitude of the magnetic forces F_1, F_2, F_3, F_4 acting on each part of the wire.
- (b) Find the direction of the resultant force $\vec{F} = \vec{F}_1 + \vec{F}_2 + \vec{F}_3 + \vec{F}_4$ acting on the wire.

Magnetic Force Application (4)

A negatively charged basketball is thrown vertically up against the gravitational field \vec{g} .

Which direction of

- (a) a uniform electric field \vec{E} ,
- (b) a uniform magnetic field \vec{B}

will give the ball a chance
to find its way into the basket?
(up/down/left/right/back/front)
