Responses to environmentally relevant microplastics are species-specific with dietary habit as a potential sensitivity indicator

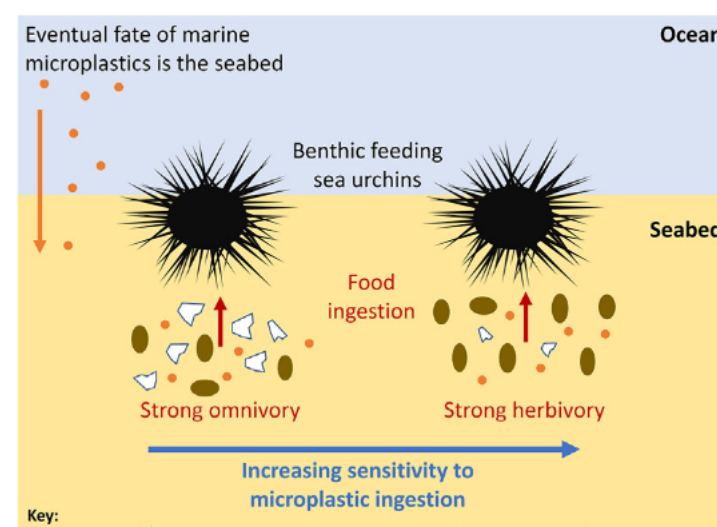

Coleen C. Suckling

Department of Fishery, Animal and Veterinary Science, University of Rhode Island, Room 129, Woodward Hall, 9 East Alumni Avenue, Kingston 02881, USA

HIGHLIGHTS

- Benthic sea urchins were externally exposed to or directly fed environmentally relevant microplastics.
- Results show species specificity with omnivore resilience and herbivore sensitivity.
- Responses cannot be generalized and dietary habit is a likely sensitivity indicator.
