24 **ABSTRACT**

25 Food safety education for children is important in developing a good foundation for food
26 safety knowledge and behaviors. The goal of the Food Safety and School Garden Program
27 (FSSGP) was to develop a curriculum that integrated food safety principles into school garden-
28 related activities for elementary school students. Specific objectives of this study were to assess
29 knowledge and evaluate the FSSGP through student activity ratings and student-to-
30 parent/guardian interaction. The two-lesson intervention consisted of a didactic component and
31 interactive activities for four major food safety principles: bacteria and washing hands, produce,
32 and containers. Students' (n=194) knowledge, grades 1-5, was evaluated using a 10-question pre-
33 and post-test. Number of correct responses increased from 5.6 ± 1.8 to 8.1
34 ± 1.9 ($P < .001$). Knowledge increased within each grade ($P < .001$) and category ($P < .05$).
35 Additionally, the majority of students rated all activities as satisfactory or better. Finally, over
36 80% of students indicated they would tell their parents/guardians about what they learned and the
37 majority of parents/guardians responding to a follow-up questionnaire, indicated that their child
38 communicated with them about FSSGP topics. This study supports the importance of early
39 education on proper food safety principles in school gardens for elementary school students.

41
42

43 **INTRODUCTION**

44 Incorporation of school garden programs in elementary and middle schools has
45 successfully increased both nutrition knowledge and consumption of fruits and vegetables in
46 children (*14, 15, 21, 25*). However, food safety has not typically been a component of school
47 garden curriculums. Children should be targeted for food safety education programs because
48 they have little existing knowledge, fewer improper food safety behaviors to unlearn (*7, 8*),
49 and a desire to share what they learn with family and friends (*13, 17*).

50 An estimated 48 million people, or 1 in 6 Americans, are affected by foodborne illness
51 annually and approximately 128,000 hospitalizations and 3,000 deaths occur each year (*3*).
52 Children are particularly at high risk to foodborne illnesses due to their underdeveloped immune
53 systems (*9, 26*). Foodborne illness outbreaks, including those due to produce, have increased for
54 the past four decades (*24, 32, 34*). Moreover, all reported foodborne illness outbreak data display
55 clear trends of increases in foodborne illnesses due to produce (*4, 11, 24*).

56 Multiple factors could possibly be associated with the increase in produce-related
57 foodborne illnesses such as, inadequate food safety knowledge resulting in unsafe food handling
58 practices (*31*) and increases in both home produce-gardens (*23, 29*) and fresh produce
59 consumption (*16, 19*). A review of observational consumer food safety studies showed that
60 consumers have relatively low levels of food safety knowledge and when observed, exhibit risky
61 food handling behaviors (*31*). While research has shown that home gardeners have inadequate
62 food safety knowledge (*29, 30*), 48% of home gardeners reported the reason they garden is to
63 grow safer produce than they can purchase (*2*). The number of home produce gardens increased
64 more than 20% since 2008 (*23*) and reports of fruit consumption significantly increased in both
65 children and adults from 2003 to 2010 (*16, 19*). Produce grown anywhere, commercial farms and

66 home and school gardens, can be the source of pathogenic microorganisms, since similar food
67 handling practices are needed to keep produce safe.

68 Commercial farmers are involved in multiple food production practices, such as growing,
69 harvesting, processing, and distributing. All steps in production have the potential for microbial
70 contamination. For example, improper personal hygiene practices, unsafe water and manure
71 treatment, and improper sanitation of equipment are potential sources (10). Home gardeners
72 plant, harvest and handle post-harvest produce, and therefore are likely to have the same
73 microbial contamination concerns (30). Currently, 33% of schools are growing an edible garden,
74 which translates into 2401 school gardens across the country (37). With the recent rise in school
75 gardens (Turner and others 2014) and the fact that microbial contamination can occur at the same
76 steps in the gardening process in both home and school gardens, a plan should be put in place to
77 minimize the risk of foodborne illness from school garden produce.

78 The impact of school garden-related food safety education programs for elementary
79 school students has not been well studied. The overall goal of this study was to create a food
80 safety program using school garden-related activities for first to fifth grade students in Rhode
81 Island. Specific objectives were to: assess students' overall knowledge change of basic school
82 garden food safety principles from pre- to post-intervention, evaluate the program via students'
83 ratings of the activities, and assess reported student-to-parent/guardian interaction.

84 **MATERIALS AND METHODS**

85 **Program design**

86 The Food Safety and School Garden Program (FSSGP) was developed based primarily
87 on the principles described in "Food Safety Tips in School Gardens" (22). Additionally, Good

88 Agricultural Practices regarding produce safety for commercial growers (10, 35) were used and
89 adapted for the FSSGP.

90 The FSSGP consisted of two, 40-60 minute interactive lessons that were divided into four
91 categories: (1) bacteria, (2) hand washing, (3) produce washing, and (4) container washing. The
92 categories, topics and interactive activities are outlined in Table 1. For example, the topics
93 included within the bacteria category were “good” versus “bad” bacteria and keeping pets and
94 animals out of the garden. The interactive activity for bacteria, Pass the Apple, was based on an
95 activity used by the University of Rhode Island’s Supplemental Nutrition Assistance Outreach
96 Education Program that uses stickers to represent the spread of bacteria (36). Due to time
97 constraints, a simulated hand washing activity was created to practice the proper method to wash
98 hands. A large activity board with laminated pictures of fruits and vegetables was created to
99 illustrate that all fruits and vegetables need to be washed. Finally, three review activities were
100 created: What’s Wrong with this Picture, Food Safety Bingo and Food Safety Jeopardy.

101 **Student assessment**

102 A 10-question, multiple-choice assessment was used to test school garden-related food
103 safety knowledge of elementary school students at pre- and post-intervention (Table 2). The
104 question and/or answer formats were modeled from previously tested food safety knowledge
105 assessments (28, 29). The questions were divided into the four categories described above and all
106 categories had three questions with the exception of container washing, which had only one
107 question. All questions had three or four response options, one of which was “I do not know”. In
108 an effort to reduce guessing, students were encouraged to circle “I do not know” if they did not
109 know the answer. Knowledge-based questions were graded as right or wrong. For statistical
110 assessment purposes, “I do not know” was considered and coded as incorrect, as it reflected a

111 lack of knowledge (29). Students that scored 80% or better were considered proficient in the
112 subject matter (29).

113 The same 10 knowledge-based questions were randomized on the post-test. The post-test
114 also included two program evaluation questions and one question on intent to disseminate, or tell
115 their parents/guardians, about information learned in the FSSGP. Program evaluation questions
116 asked students to circle the topic they felt was most important and to rate how much they liked
117 each activity. A modified facial rating scale was used for program evaluation response options
118 (12, 28). Students had the option to circle a smiling face, neutral face, or frowning face if they
119 liked the activity, thought it was okay or disliked it, respectively.

120 The pre- and post-tests were administered to all participating students and each question was
121 read aloud to compensate for all reading and comprehension levels (28). Students were assigned
122 ID numbers corresponding to the pre- and post-tests and teachers kept the student ID rosters
123 between lessons to maintain student anonymity. Only students who completed both pre- and
124 post-tests were included in the statistical analyses. Two educational specialists reviewed the
125 assessments for readability and clarity and revisions were made as suggested.

126 **Parent/Guardian letter and follow-up**

127 At the start of the first lesson, participating teachers sent home a letter to all
128 parents/guardians regarding the FSSGP. At the completion of the program, students were given a
129 follow-up questionnaire as well as a “Garden to Table – Five Steps to Food Safe Fruit and
130 Vegetable Home Gardening Booklet” to take home for their parents (27). A parent/guardian
131 follow-up was used to determine the extent of child to parent/guardian interaction. The three
132 questions on the questionnaire were: (1a) did your child communicate to you about the content of
133 the program; (1b) did you learn anything from your child?; (2) do you have a home fruit or

134 vegetable garden?; and (3) what grade is your child in?. Parents/guardians were encouraged to
135 complete the questionnaire and return it to their child’s teacher within one week. Any responses
136 indicated by parents/guardians that were unrelated to food safety or gardening were not included
137 in the analysis.

138 **Program implementation**

139 The Institutional Review Board at the University of Rhode Island approved the study
140 protocol, assessments, and educational materials.

141 The elementary school students who participated in the FSSGP were recruited through
142 the existing Farm Fresh Rhode Island (Pawtucket, Rhode Island) Farm to School programs. The
143 two lessons were conducted at least one week apart between September and December 2014.
144 The first lesson began with the pre-test followed by instruction on the first three categories. The
145 second lesson included a review of the first lesson, instruction on the fourth category, and review
146 activities that incorporated all information presented to the students (Table 1). All students
147 participated in the “What’s Wrong with this Picture?” activity (28) and either Food Safety Bingo
148 (grades 1-3) or Food Safety Jeopardy (grades 4-5). At the end of the second lesson, students
149 completed the post-test. Students were given an educational handout that summarized sources of
150 bacteria from the garden and how to prevent the spread of bacteria, a “Wash Fruits and
151 Vegetables Before Eating” pencil, and small bar of soap that was used in the simulated hand
152 washing activity.

153 **Statistical analysis**

154 The statistical software, SPSS (Version 21.0, 2012, Armonk, NY), was used for all
155 statistical analyses. Means with standard deviations and descriptive statistics (frequencies and
156 percentages) were reported for the knowledge-based pre- and post-tests and program evaluation

157 responses. Paired *t*-tests were used to determine mean score differences at 95% confidence
158 interval for overall score and within grades. Differences between grades on pre- and post-tests
159 were analyzed using analysis of variance with a Scheffe Post Hoc test. Analysis of covariance
160 was used to determine if post-test knowledge score differences remained significant between
161 grades when controlling for the differences in pre-test scores. Finally, Pearson's chi-square test
162 was used to assess knowledge within each category on pre- and post-tests.

163 **RESULTS**

164 A total of 203 students from four Rhode Island elementary schools participated in the
165 first lesson and completed the pre-test of the FSSGP. Two schools were located in Providence,
166 one in Pawtucket, and one in Newport. Ninety-four-percent (183/194) of students completed the
167 program during regular school hours: 34%, 27%, 9%, 20%, and 10% of the students were in first,
168 second, third, fourth, and fifth grade, respectively (Table 3). The remaining 6% (11/194) were
169 first and second grade students in an after school program.

170 **Knowledge responses**

171 Students had a mean knowledge score of $55.6 \pm 18.8\%$ on the pre-test and $80.6 \pm 18.6\%$
172 on the post-test, which was a 25 percentage point increase in knowledge ($P < .001$) (Table 4).
173 Significant knowledge increases also occurred from pre- to post-test within all grades ($P < .001$).
174 Second grade students ($n=56$) had the highest increase (31.7%) and first graders ($n=67$) had the
175 least (18.2%). Most students answered between 4 and 6 questions correctly (range: 1-10) on the
176 pre-test; whereas the majority of students answered 9 or 10 questions correctly (range: 2-10) on
177 the post-test (Fig. 1).

178 First grade pre- and post-test scores were significantly lower than all other grades ($P <$
179 $.05$); mean post-test score for first grade, $64.1 \pm 18.3\%$, versus $90.7 \pm 11.3\%$, $85.2 \pm 11.8\%$, 88.1

180 $\pm 12.6\%$, and $90.6 \pm 11.1\%$ for second grade, third grade, fourth grade, and fifth grade students,
181 respectively. Grades two through five did not significantly differ from each other. Analysis of
182 covariance determined that statistical significance was independent of the initial knowledge
183 score variations.

184 Pre- and post-test knowledge scores for each category are illustrated in Figure 2. Correct
185 baseline knowledge for container washing was the highest and produce washing the lowest,
186 77.6% and 12.9%, respectively. The container washing category consisted of one question,
187 whereas the other three categories consisted of three questions. Overall, knowledge within each
188 category improved significantly ($P < .05$) following the intervention.

189 **Program evaluation**

190 The majority of the students rated each activity as okay or better on the post-test evaluation
191 (Table 5). More than half of the students indicated that they liked the activities “very much”.
192 Additionally, 84% (n=161) of the students indicated that they would tell their parents/guardians
193 about what they learned in the FSSGP (data not shown).

194 **Parent/Guardian follow-up**

195 A total of 59 (30%) parent/guardian follow-up questionnaires were returned to the
196 teachers. Of the 59 returned, 76% (n=45) of the parents/guardians indicated their child spoke
197 with him/her about the FSSGP. Only two returned questionnaires were not used since topics
198 mentioned were unrelated to those taught in the FSSGP. Fourth and fifth grade students had the
199 highest return rate at 44% (16/36) and 55% (10/18), respectively. First graders had the lowest
200 return rate at 13% (8/63) and second and third graders returned 39% and 36%, respectively.

201 Written responses were compiled and categorized into five categories: bacteria, hand
202 washing, produce washing, animals, and other (Fig. 3). Any topic mentioned that did not fall into

203 one of the first four categories but was related to food safety or gardening, was included in the
204 “other” category. The “other” topics were grouped into one category due to the low frequency
205 and high variability of each topic. Examples of topics in the “other” category included any
206 response about general food safety, gardening, planting, and containers. Of the 45
207 parents/guardians who indicated that their child spoke to them about the program, the majority
208 wrote one or more school garden-related food safety topics.

209 **DISCUSSION**

210 The goal of this study was to create a food safety education program for elementary
211 schools regarding food safety for school gardens. The students’ overall knowledge of school
212 garden-related food safety increased, from pre- to post-intervention, across all grades.

213 Implementation of the FSSGP with first through fifth grade students could be used to increase
214 overall garden-related food safety knowledge.

215 While first grade students’ knowledge increased significantly, they scored significantly
216 lower than the other four grades on both the pre- and post-test. The lower scores could be due to
217 lower reading levels (5) or the complexity of the program information. Many of the first grade
218 students were unable to read and despite reading both assessments aloud, misunderstanding
219 and/or misinterpretation of questions could have occurred. The FSSGP may be less suitable for
220 first graders as compared to second through fifth. However, there was still a significant impact
221 on knowledge of first graders though it was lower than the other four grades.

222 Overall, the students became proficient (>80%) (29) in the school garden food safety
223 material after the intervention. More specifically, prior to the intervention, more than half of
224 students indicated that it was acceptable to eat directly out of the garden without washing.

225 Following the intervention, 80% of the students answered the question correctly indicating that

226 eating directly from the garden without washing was unsafe. The consequence of eating directly
227 from the garden without washing is an increased risk for foodborne illness. Since children have a
228 heightened susceptibility to foodborne illness, food safety education prior to engaging in school
229 garden activities would be desirable.

230 While all categories reflected a significant increase in knowledge, the container category
231 appeared to have the highest pre- and post-knowledge scores. However, the interpretation of this
232 result may be unclear since this category had only one question whereas the other three
233 categories had three questions each. Results may have been different had more questions been
234 asked in this category. The constraints of a 10-question assessment resulted in an unequal
235 distribution of category questions. However, based on previous food safety knowledge
236 assessments for elementary-aged students, a short assessment was regarded as optimal (6, 28).

237 It has been well established that students enjoy learning and retain information better if
238 practically or experientially applied (6, 8, 38). In previous studies, students who participated in
239 experiential-based food safety programs rated activities highly (8, 17, 28). This study produced
240 similar results: the majority of the students rated all activities as satisfactory (okay) or better
241 while simultaneously and significantly increasing their knowledge. Faccio, E., N. Costa (8)
242 found the students in the experiential group of their study learned and retained significantly more
243 complex and detailed food safety information compared to the students in the didactic,
244 theoretical approach group. Similarly, students participating in nutrition education and school
245 garden activities retained more nutrition knowledge post-intervention than those exposed only to
246 nutrition education and those in the control group (18, 21, 25). Therefore, the knowledge
247 increases across all grades could be attributed to the practical application of knowledge through
248 the interactive activities and concluding games.

249 Food safety education programs for students are primary prevention for foodborne
250 illnesses (17) and are often conducted in school settings. Few food safety education programs
251 have been conducted with students in after school programs. The after-school class of students
252 that participated in the FSSGP was used as a pilot test to determine whether or not the
253 curriculum would be suitable in this type of learning environment. Though several students
254 appeared distracted and restless during the instruction, there were no significant knowledge
255 differences between the first and second graders in the after-school program compared with
256 students in the in-school classes (data not shown).

257 Upon completion of the program, 161 students indicated they would tell their
258 parents/guardians about the FSSGP and what they learned. Thirty percent (59/194) of all
259 parent/guardian follow-up questionnaires were returned. Based on the number and variety of
260 topics written by parents/guardians, the children were able to reiterate and explain a variety of
261 the garden-related food safety topics upon returning home. Parents/guardians described multiple
262 topics, for example, wash your hands for 20 seconds; keep animals out of the garden; and wash
263 your fruits and veggies before eating them. The approach and effect of children's intent to
264 disseminate information to their families has been elucidated by the Theory of Planned Behavior
265 (1). This behavioral theory describes that intention is the strongest predictor of actual behavior.
266 Thus, children who intended to tell their parents/guardians what they learned may be more likely
267 to engage in proper food safety behaviors and teach what they learned to their family.
268 Parent/guardian responses on the follow-up reflected a strong indication that students understood
269 the information and taught their family what they learned. Additionally, students who spoke to
270 their parents/guardians may be retaining more of the information (17).

271 Parents/guardians are often targeted for food safety education programs, as they are
272 typically the primary food preparer in the home (20, 33). However, findings from this study
273 support existing research that children are able to gain knowledge of correct food safety
274 principals, start to develop proper food safety behaviors, and continue to build the fundamental
275 foundation of food safety knowledge and behaviors (6, 8). The results of this study show that
276 educating children on – food safety principles related to school gardening also allows the family
277 to be a secondary target audience that will receive proper food safety information.

278 **CONCLUSION**

279 The FSSGP was successful at increasing elementary school student’s knowledge of
280 school garden-related food safety principles, as evidenced by the significant increase in overall
281 knowledge within each grade. This curriculum was appropriate for multiple grade levels (grades
282 1-5) Secondly, the FSSGP impacted a secondary target audience, the parents/guardians, via the
283 elementary school students, as evidenced by the 23% response rate from the follow-up
284 questionnaire indicating that the students were transferring the information and new knowledge
285 that they learned in the classroom. Finally, the interactive activities, rated as satisfactory or
286 better by the majority of students, may have helped to reinforce the information taught in the
287 program. The curriculum was part of a Master’s thesis project and can be found at
288 <http://digitalcommons.uri.edu/cgi/viewcontent.cgi?article=1599&context=theses>.

289 For future research, the FSSGP could be tested in after-school programs on a larger scale
290 and in summer camps that incorporate gardening activities. Perhaps incorporating additional
291 hands-on garden activities into the program may further the development of proper food safety
292 behaviors. The FSSGP was conducted in a primarily urban population and could be tested in first
293 to fifth grade classes in other rural or suburban schools.

294

295 **ACKNOWLEDGEMENT**

296 This work was supported by USDA/FNS Award CN-F25-SS-14-RI-01 administered
297 through Farm Fresh RI and USDA National Institute of Food and Agriculture, Hatch Project
298 #100765 with URI Land Grant contribution number 5425. We would like to acknowledge

416

417 *Table 2. Pre- and post-test knowledge questions for the participants in the food safety and*
 418 *school garden program*

Questions	Responses*
1. Jason has been playing in the garden. He comes into the kitchen to eat some blueberries. Jason looks at his hands. There is no dirt on them and they look clean. Does he need to wash his hands?	a. Yes b. No c. I do not know
2. Do you think all bacteria in food will make you sick?	a. Yes b. No c. I do not know
3. You are harvesting the fruits and vegetables that are in the school garden. After you have picked them, they look great to eat. You want to see how they taste so you take a bite. What do you think?	a. This is okay to do b. This is not okay to do c. I do not know
4. Joe has found some bird poop on a cucumber in the garden. He knows that he should not eat poop, so he washes the cucumber and eats it. What do you think?	a. This is okay to do b. This is not okay to do c. I do not know
5. John found a cracked peach within the batch of peaches he picked from the garden. What should he do with the peach?	a. Throw the whole peach in the trash b. Ask an adult to cut off the bad part c. Eat the whole peach anyway d. I do not know
6. You can always tell if a fruit or vegetable might make you sick.	a. Yes b. No c. I do not know

7. Mary's mother asked her to go and pick a few peppers from the garden. Mary washed her hands before she went into the garden even though she might get dirt on them while picking peppers. Did she need to wash her hands before going into the garden?	<ul style="list-style-type: none"> a. Yes b. No c. I do not know
8. Sarah's pet dog, Barky, followed Sarah into the garden when she was going to pick some spinach for lunch. Is it okay for Barky to play in the garden too?	<ul style="list-style-type: none"> a. Yes b. No c. I do not know
9. Susan decided to pick carrots from the garden and she found a container in the garage. What should she do first?	<ul style="list-style-type: none"> a. Use it if it looks clean b. Shake out the dirt c. Wash the container d. I do not know
10. Carrie's hands were very dirty from helping her dad pick tomatoes in the garden. How long should she wash her hands with warm soapy water?	<ul style="list-style-type: none"> a. 5 seconds b. 10 seconds c. 20 seconds d. I do not know
