

Amgen Seminar Series in Chemical Engineering
in
Cherry Auditorium, Kirk Hall, 1 PM

Presents on April 10, 2014

Water in biopharmaceutical manufacturing

By

Dr. Derek N. Adams
Vice President and Plant Manager
Alexion Rhode Island Manufacturing Facility

The use of water in biopharmaceutical manufacturing is tightly controlled and supremely important to the quality of the products. It is often the single most used raw material and the one that comes to mind last even in the most experience biopharmaceutical professionals. This presentation will explore the types of water, how they are generated, how they are used, and how water is disposed of in biopharmaceutical manufacturing processes.

This series at the University of Rhode Island is made possible through the generosity of Amgen, West Greenwich, R.I.

Refreshments provided by the Joseph Estrin Endowment.
